

# SERVICE MANUAL

DUAL BAND FM TRANSCEIVER

**IC-3210A**

**IC-3210E**

---

## INTRODUCTION

---

This service manual describes the latest service information for the IC-3210A/E DUAL BAND FM TRANSCEIVER at the time of going to press.

Three versions of the IC-3210A/E have been designed. This service manual covers following versions.

MODEL	VERSION NUMBER	AREA
IC-3210E	#02	Europe
IC-3210A	#05	U.S.A.
	#07	Australia

---

## DANGER

---

**NEVER** connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

**DO NOT** expose the transceiver to rain, snow or any liquids.

**DO NOT** reverse the polarities of the power supply when connecting the transceiver.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

---

## ORDERING PARTS

---

Be sure to include the following four points when ordering replacement parts:

1. Component part number and name
2. Equipment model name and unit name
3. 10-digit order numbers for mechanical parts
4. Quantity required

### <SAMPLE ORDER>

IC PLL2001S IC-3210A MAIN UNIT 5 pieces  
Screw FH M2.6×4 IC-3210A Front panel 8810002100 10 pieces

Addresses are provided on the inside back cover for your convenience.

---

## REPAIR NOTE

---

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from a power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 30 dB~40 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

# SECTION 1 SPECIFICATIONS

## ■ GENERAL

- Frequency coverage :
 

MODEL	VERSION	VHF	UHF
IC-3210A	U.S.A.	138.00 ~ 174.00 MHz* (Rx) 140.00 ~ 150.00 MHz* (Tx)	440.00 ~ 450.00 MHz
IC-3210A	Australia	144.00 ~ 148.00 MHz	430.00 ~ 440.00 MHz
IC-3210E	Europe	144.00 ~ 146.00 MHz	430.00 ~ 440.00 MHz
- \* Specifications apply to only 144.00 ~ 148.00 MHz.
- Mode : F3 (FM)
- Selectable tuning step : 5, 10, 15, 20 and 25 kHz (IC-3210A)  
12.5 and 25 kHz (IC-3210E)
- Memory channels : 20 (double-spaced) memory channels plus two call channels
- Antenna impedance : 50 Ω
- Power supply requirement : 13.8 V DC ± 15 % (negative ground)
- Current drain : Receive standby 550 mA  
max. audio 900 mA (except full duplex operation)  
Transmit high 7.6 A  
low 3.6 A
- Usable temperature range : -10 °C ~ +60 °C (+14 °F ~ +140 °F)
- Frequency stability : ±10 ppm (-10 °C ~ +60 °C)
- Dimensions : 140(W) × 50(H) × 180(D) mm  
5.5(W) × 2.0(H) × 7.1(D) inches  
(Projections not included)
- Weight : 1.2 kg (2.6 lbs.)

## ■ TRANSMITTER

- Output power : 25 W (high), 5 W (low)
- Modulation system : Variable reactance frequency modulation
- Max. frequency deviation : ±5 kHz
- Spurious emissions : Less than -60 dB
- Microphone impedance : 600 Ω

## ■ RECEIVER

- Receive system : Double-conversion superheterodyne
- Intermediate frequency : 1st 30.875 MHz  
2nd 455 kHz
- Sensitivity : 0.18 μV for 12 dB SINAD
- Selectivity : More than 12.5 kHz / -6 dB  
Less than 30.0 kHz / -60 dB
- Audio output power : More than 2.4 W at 10 % distortion with an 8 Ω load
- Audio output impedance : 8 Ω

All stated specifications are subject to change without notice or obligation.

# SECTION 3 BLOCK DIAGRAM

## SECTION 4 CIRCUIT DESCRIPTION

### 4-1 RECEIVER CIRCUITS

#### 4-1-1 VHF ANTENNA SWITCHING CIRCUIT (VHF PA UNIT)

Received VHF signals enter the antenna connector and pass through a three-stage Chebyshev low-pass filter (C12~C15, L3, L4, L6). The signals are applied to the antenna switching circuit (D2, D4), and then to the VHF RF circuit.

#### 4-1-2 VHF RF CIRCUIT (RX UNIT)

The signals from the VHF antenna switching circuit pass through a bandpass filter (L8, C40~C43, D7), and are applied to the RF amplifier (Q4). Amplified signals are reapplied to the bandpass filter (L5~L7, C24, C26, C27, C29, C30, C32, C33, D4~D6), and are then applied to the VHF 1st mixer (Q3). The bandpass filters suppress out-of-band signals. D4~D7 are varactor diodes that track the bandpass filters and are controlled by the lock voltage of the VHF PLL. These diodes tune the center frequency of the bandpass filters for wide bandwidth reception and good image response rejection.

#### 4-1-3 UHF ANTENNA SWITCHING CIRCUIT (UHF PA UNIT)

Received UHF signals enter the antenna connector and pass through a two-stage Chebyshev high-pass filter (C35~C37, L13, L14) and a two-stage Chebyshev low-pass filter (C32~C34, L11, L12). The signals are applied to the antenna switching circuit (D5, D7), and then to the UHF RF circuit.

#### 4-1-4 UHF RF CIRCUIT (RX UNIT)

The signals from the UHF antenna switching circuit pass through a tuning circuit (L15, C67, C70), and are applied to the RF amplifier (Q8). Amplified signals are applied to the bandpass filter (L13), amplified at Q7, applied to the bandpass filter (L11), and are then applied to the UHF 1st mixer (Q6). The bandpass filters consisting of helical coils suppress out-of-band signals.

#### 4-1-5 1ST MIXER CIRCUIT (RX UNIT)

When VHF receiving, a mixer switch (Q2) is turned ON, activating the VHF 1st mixer (Q3). The signals from the VHF RF circuit are mixed with the "V.LO" signal from the MAIN UNIT to produce a 30.875 MHz 1st IF signal. At the same time, the mixer switch (Q5) is turned OFF to prevent interference from the UHF RF circuit.

When UHF receiving, Q5 is turned ON, activating the UHF 1st mixer (Q6). The signals from the UHF RF circuit are mixed with the "U.LO" signal from the MAIN UNIT to produce a 30.875 MHz 1st IF signal. At the same time, Q2 is turned OFF to prevent interference from the VHF RF circuit.

#### 4-1-6 1ST IF CIRCUIT (RX UNIT)

After passing through the matching circuit (L3, C11), the 1st IF signal is applied to a pair of crystal filter (F1) to suppress out-of-band signals. The 1st IF signal is matched at L2 and C4, amplified at Q1 and then applied to the 2nd mixer circuit. D1 and D2 function as the limiter circuit when a strong signal is received.

#### 4-1-7 2ND IF AND DEMODULATOR CIRCUITS (RX UNIT)

The 1st IF signal amplified at Q1 is applied to the 2nd mixer section of IC1, and is mixed with the 2nd LO signal to be converted to a 455 kHz 2nd IF signal. IC1 contains the 2nd mixer, local oscillator, limiter amplifier and quadrature detector circuits. The local oscillator section and X1 generate 30.42 MHz for the 2nd LO signal.

The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through the ceramic filter, F12, where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC1, pin 5) and applied to the quadrature detector section (IC1, pin 8 and ceramic discriminator X2) to demodulate the 2nd IF signal into an AF signal.

AF signal output from pin 9 of IC1 is applied to the AF circuit and squelch circuit.

#### IF CIRCUIT

Fig. 1

## 4-1-8 AF CIRCUIT (RX UNIT)

The AF signal from IC1 is applied to a two-stage active filter consisting of IC2a and IC2b. The filter functions as a de-emphasis circuit with frequency characteristics of  $-6$  dB/octave as well as a high-pass filter to suppress tone signals for the tone squelch operation.

The filtered signal passes through the AF mute circuit (Q14) and the volume control (R6). When the squelch is closed, Q14 is activated as the AF mute switch. The AF signal is power-amplified at the AF amplifier (IC3) and then applied to the speaker.

## 4-1-9 SQUELCH CIRCUIT (RX UNIT)

Some of the noise components in the AF signal from IC1 is applied to pin 10 of IC1 via the squelch control (R7). The squelch control adjusts the noise level.

The active filter section in IC1 amplifies noise components of frequencies of 20 kHz and above, and outputs the resulting signals from pin 11. Output signals are rectified by D13 and D14.

The rectified voltage triggers the squelch switch (Q13). The collector of Q13 outputs the squelch signal. The signal activates the AF mute circuit and turns Q17 ON to cut the AF signal from the volume control. The squelch signal is applied to Q13 on the LOGIC UNIT, turning OFF the [RX] indicator.

## 4-1-10 RECEIVER CONTROL CIRCUIT (RX UNIT)

IC6 forms an output expander to convert serial data from the CPU into receiver control signals. IC6 outputs control signals for the VHF and UHF receiver circuits. IC6 also outputs a beep tone and AF mute signals.

## VHF TRANSMITTER CIRCUIT

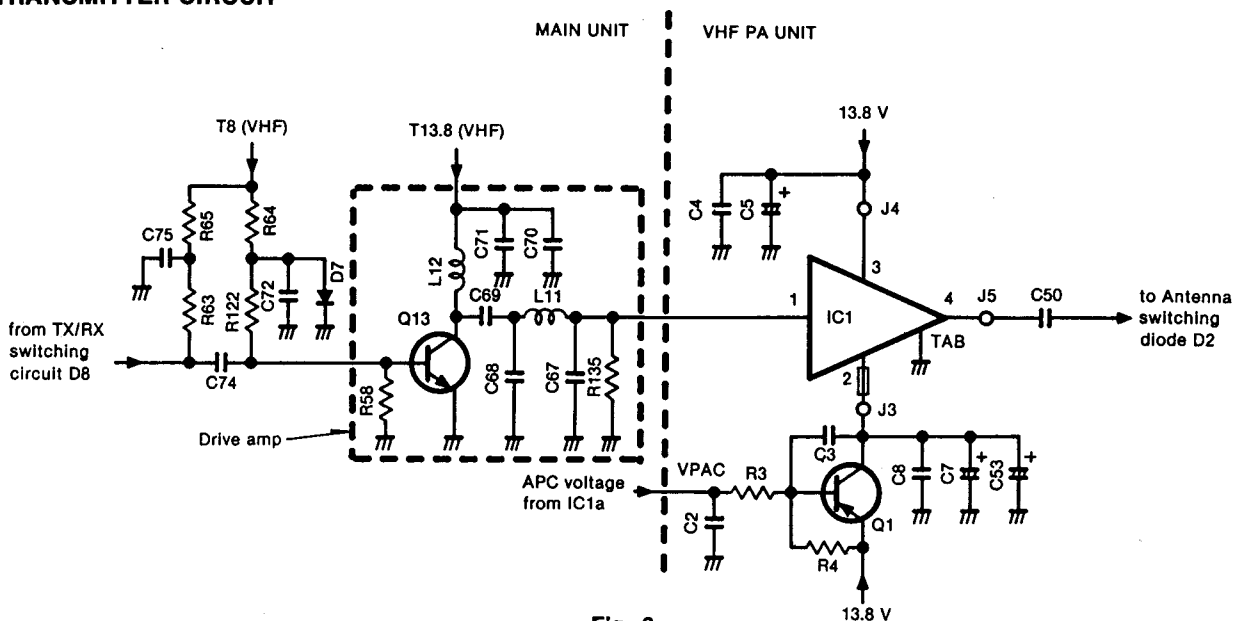

Fig. 2

## 4-2 TRANSMITTER CIRCUITS

### 4-2-1 MICROPHONE AMPLIFIER (MAIN UNIT)

AF signals from the microphone amplified at Q30 are applied to IC9b pin 5, and are pre-emphasized to 6 dB/octave through C120 and R113 connected to pin 6. IC9b functions as the microphone amplifier and the limiter.

The signals and a tone signal pass through the splatter filter circuit (IC9a) where signals of 3 kHz and above are attenuated. IC9 pin 1 then outputs the signals. The signals are applied to the VCO circuits to produce an FM signal.

### 4-2-2 VHF DRIVE AMPLIFIER (MAIN UNIT)

The VHF VCO output is buffer-amplified at Q15, and applied to the transmit/receive switching circuit (D8).

After passing through the transmit/receive switching circuit (D8), the VCO output is amplified at the drive amplifier (Q13) where 200 mW is obtained.

### 4-2-3 VHF RF POWER AMPLIFIER (VHF PA UNIT)

IC1 is a power module which provides a stable 25 W output power.

An RF signal from the drive amplifier (Q13) is applied to pin 1 of IC1. The amplified signal is output from pin 4, and applied to the antenna connector through the diode switching and low-pass filter circuits.

#### 4-2-4 UHF DRIVE AMPLIFIER (MAIN UNIT)

The UHF VCO output is buffer-amplified at Q10, and applied to the transmit/receive switching circuit (D6).

After passing through the transmit/receive switching circuit (D6), the VCO output is amplified at the pre-driver (Q8) and the drive amplifier (Q7). Q7 is controlled by a collector current from Q3 on the UHF PA UNIT.

#### 4-2-5 UHF RF POWER AMPLIFIER (UHF PA UNIT)

IC2 is a power module which provides a stable 25 W output power.

An RF signal from the drive amplifier (Q7) is applied to pin 1 of IC2. The amplified signal is output from pin 5, and applied to the antenna connector through the low-pass filter, diode switching, low-pass filter and high-pass filter circuits.

#### 4-2-6 APC CIRCUIT (PA UNITS AND MAIN UNIT)

To obtain a stable RF output power, the APC circuit detects a current of the power module's final stage and controls a voltage of the power module's first stage and UHF drive amplifier.

The "VPAV" and "UPAV" voltages, generated in the VHF and UHF PA UNITS, are applied to the APC differential amplifiers IC1a and IC1b on the MAIN UNIT respectively.

The output voltages are applied to Q1 (VHF PA UNIT) or Q3 (UHF PA UNIT) to control the RF output power.

#### 4-2-7 POWER OUTPUT CONTROL CIRCUIT (MAIN UNIT)

The power output control circuit consists of R9~R14 and Q1. This circuit selects the RF output power by changing the output voltage of the APC circuit.

When HIGH output power is selected, Q1 is turned OFF. RF output power is adjusted with R16 (VHF) or R7 (UHF). R7 and R16 set the APC reference voltage of the APC amplifiers.

When LOW output power is selected, Q1 is turned ON. R9~R14 are connected to the output of the APC amplifiers, reducing the output voltage. RF output power is adjusted with R12 (VHF) or R10 (UHF).

#### 4-2-8 ANTENNA SWITCHING CIRCUIT (RF UNIT)

When VHF transmitting, D2 and D4 are turned ON. The RF output signal from IC1 is not applied to the receiver circuit, passing through C50 and D2, the low-pass filter (C12~C15, L3, L4, L6) and then on to the antenna. The low-pass filter suppresses high harmonic components.

When UHF transmitting, D5 and D7 are turned ON. The RF output signal from IC2 is not applied to the receiver circuit, passing through the low-pass filter (L9, C25, C26), D5, the low-pass filter (C32~C34, L11, L12), the high-pass filter (C35~C37, L13, L14) and then on to the antenna. The low-pass filters suppress high harmonic components.

#### 4-2-9 TRANSMITTER CONTROL CIRCUIT (MAIN UNIT)

IC4 forms an output expander to convert serial data from the CPU into transmitter control signals. IC4 outputs control signals for the VHF and UHF transmitter circuits. IC4 also outputs a low power selection and VCO control signals.

### 4-3 VHF PLL CIRCUITS

#### 4-3-1 GENERAL

The VHF PLL circuit, using a direct programmable divider (IC6), directly generates the desired frequency with the VCO circuit. IC6 sets the dividing ratio based on serial data from the CPU, and compares the phases of the VCO signal and the reference oscillator frequency. It detects the out-of-step phase and outputs it.

#### PLL CIRCUIT BLOCK DIAGRAM

Fig. 3

#### 4-3-2 REFERENCE OSCILLATOR CIRCUIT (MAIN UNIT)

A reference frequency is produced by Q41 and X2. The frequency is adjusted with C102. The reference frequency is applied to both the VHF and UHF PLL circuit.

### 4-3-3 CHARGE PUMP AND LOOP FILTER CIRCUITS (MAIN UNIT)

Phase-detected signals from pins 5 and 12 are converted to DC voltage by the charge pump Q43~Q45; and the loop filter consisting of R144, R145, R157 and C197. Q42 provides rapid PLL lock-up time when the PLL is unlocked.

The frequency at which the VHF VCO oscillates is controlled by varactor diodes (D1, D2). DC voltage (VHF PLL lock voltage) is provided through the loop filter.

The output of the loop filter is applied to the DC amplifier (Q23, Q24), and is used as voltage to control the bandpass filter (D4~D7) of the VHF receiver RF circuit.

### 4-3-4 VHF VCO CIRCUIT

The VHF VCO circuit forms a Hartley oscillator circuit (Q1). Varactor diodes (D1, D2) provide frequency control. The buffer amplifier (Q2) is unaffected by VCO oscillation.

## 4-4 UHF PLL CIRCUITS

### 4-4-1 GENERAL

The UHF PLL circuit, using a dual modulus prescaler (IC7, IC8), directly generates the desired frequency with the VCO circuit. The dual modulus prescaler (IC7, IC8) sets the dividing ratio based on serial data from the CPU, and compares the phases of the VCO signal and the reference oscillator frequency. It detects the out-of-step phase and outputs it. The reference frequency oscillated at X2 is applied to the PLL IC (IC7 pin 2).

### 4-4-2 LOOP FILTER CIRCUIT (MAIN UNIT)

Phase-detected signals from pins 16 and 17 are converted to DC voltage by the active low-pass filter (loop filter: Q18, Q19).

The frequency at which the UHF VCO oscillates is controlled by varactor diodes (D1, D2). DC voltage (UHF PLL lock voltage) is provided through the loop filter.

### 4-4-3 UHF VCO CIRCUIT

The UHF VCO circuit forms a transformed Colpitts oscillator circuit (Q1). Strip lines are used for stable oscillation over a wide frequency range. Varactor diodes (D1, D2) provide frequency control. The buffer amplifier (Q2) is unaffected by VCO oscillation.

## UHF VCO CIRCUIT

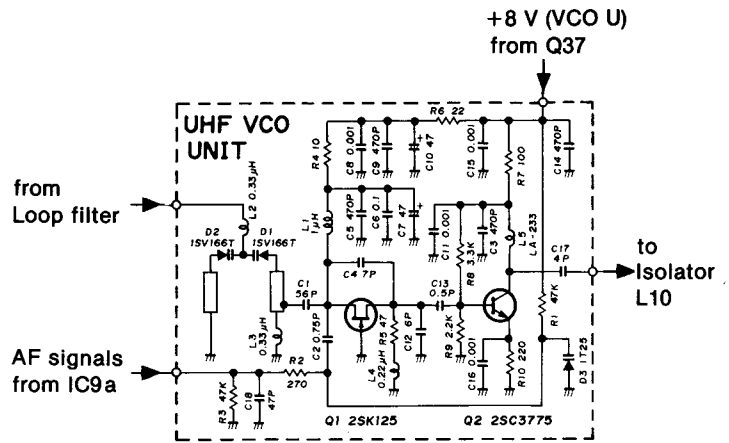

Fig. 4

## 4-5 LOGIC CIRCUITS (LOGIC UNIT)

### 4-5-1 RESET CIRCUIT

The CPU (IC1) is reset when the RESET port changes from "HIGH" to "LOW" and then becomes "LOW" again. The RESET port remains "HIGH" except when the CPU is reset.

The following is a diagram for the reset circuit and timing chart.

### RESET CIRCUIT

Fig. 5

### RESET TIMING CHART

Fig. 6

## 4-5-2 CPU PORT ALLOCATIONS

PORT NUMBER	PIN NUMBER	DESCRIPTION
RESET	68	When a "HIGH" signal is applied here the CPU is initialized or changes to standby mode.
P00 [INT4]	38	Detects a signal for the standby mode of the CPU. The CPU enters the standby mode when the port reads a trailing edge of the signal.
P01 [SCK]	39	Outputs clock signals.
P02 [DATA]	40	Outputs serial data synchronized with the SCK signal.
P03 [SQLS]	41	Detects a squelch signal. When the signal is "HIGH," the squelch opens.
P10~P13 [KIR0~KIR3]	42~45	Input ports for the initial matrix.
P20 [STBTX]	46	Outputs a strobe signal for serial data to the output expander (transmitter control).
P21 [STBRX]	47	Outputs a strobe signal for serial data to the output expander (receiver control).
P22 [STBPLV]	48	Outputs a strobe signal for serial data to the VHF PLL IC.
P23 [STBPLU]	49	Outputs a strobe signal for serial data to the UHF PLL IC.
P30 [UNLKV]	50	Detects a VHF PLL unlock signal. When the signal is "HIGH," the VHF PLL is unlocked. Normally the port is "LOW."
P31 [UNLKU]	51	Detects a UHF PLL unlock signal.
P32 [TXLED]	52	Outputs a signal for turning the [TX] indicator ON and OFF. The port becomes "LOW" and "HIGH" when transmitting and receiving (squelch opens) respectively.
P33 [SRFO]	53	Outputs a reference voltage for the S/R/F indicator.
P40~P43 [KR0~KR3]	29~32	These are input ports for the key matrix.
P50~P53 [KS0~KS3]	34~37	These are output ports for strobe signals for the initial and key matrix.
P60 [SRFI]	60	Inputs a resulting signal from S/R/F indicator circuit.
P61 [PTT]	61	Inputs a signal on the PTT line. The port should be "HIGH" when the PTT switch is pushed.
P62 [TSQL]	62	Input port for an acknowledge signal in the optional tone squelch unit. The port is "HIGH" when the tone squelch opens.
P63 [OPT]	63	Input port whether the optional tone squelch unit is installed or not. The port is "LOW" when the tone squelch unit is installed.
P70 [STBOP]	64	Outputs a strobe signal for serial data to the optional tone squelch unit.
P71 [STBCT]	65	Outputs a strobe signal for serial data to the output expander for subaudible tone IC (S7116A).
P72, P73 [DIM01, DIM02]	66, 67	Outputs a signal for controlling intensity of the function display. Refer to Table 2.

Table 1

## 4-5-3 KEY MATRIX

Fig. 7

#### 4-5-4 S/R/F INDICATOR CIRCUIT

IC3 functions as a comparator. IC1 pin 53 outputs a "HIGH" signal as a reference voltage to a detected S/R/F signal level.

##### • Relative signal strength indicator

When receiving, the 455 kHz 2nd IF signal, amplified at Q9 and Q10 on the RX UNIT, is rectified at D17 and D18 to be converted to DC voltage as an "SRF" signal.

The signal is applied to IC3 pin 2 on the LOGIC UNIT. IC3 pin 1 outputs a "HIGH" signal when the voltage at pin 3 becomes the same as or higher than the SRF voltage at pin 2. It takes time to output "HIGH" from IC3 pin 1 after IC1 pin 53 outputs "HIGH." The time depends on the level of the SRF voltage. The higher the level of SRF voltage, the longer time it takes. IC1 measures the time and the S/R/F indicator displays the relative signal strength.

#### S/R/F INDICATOR CIRCUIT

Fig. 8

##### • RF output power selection indicator

Q2 and D3 on the VHF PA UNIT detects VHF RF output power. Q2 outputs a "HIGH" signal whether high or low output power is transmitted. Q4 on the UHF PA UNIT also outputs a "HIGH" signal during UHF transmitting. The signal from Q2 or Q4 is applied to IC3 pin 2 on the LOGIC UNIT. IC3 pin 1 outputs a "HIGH" signal to the CPU. The CPU detects either high or low output power with the key matrix of P42 and P50.

#### 4-5-5 DIMMER CIRCUIT

The function display changes its brightness at 4 levels using combinations of output level at P72 and P73. By changing levels at P72 and P73, the base voltage and collector current changes. Therefore, the collector voltage is changed and brightness of lamps DS2~DS4 changes.

#### DIMMER CIRCUIT

Fig. 9

BRIGHTNESS	P72	P73	INDICATION
↑ Brightness ↓	H	H	d-4
	L	H	d-3
	H	L	d-2
	L	L	d-1

Table 2

#### 4-6 OTHER CIRCUITS

##### 4-6-1 REGULATOR CIRCUITS (RX UNIT)

IC4 is a 3-terminal voltage regulator IC chip. +13.8 V is applied to pin 1 and pin 3 outputs +9 V. The regulated voltage is applied to each unit.

IC5 is a 3-terminal voltage regulator IC chip. +13.8 V is applied to an input terminal and the output terminal outputs +5.5 V using D30.

##### 4-6-2 DC-DC CONVERTER (MAIN UNIT)

A DC-DC converter consisting of IC5 and Q2 creates approximately 30 V DC from 9 V DC to obtain wide range lock voltages for the PLL circuits and a power source for the DC amplifier consisting of Q23 and Q24. This DC amplifier amplifies the control voltage for the varactor diodes (D4~D7) of the bandpass filter located in the VHF RF circuit. The noise components of the output of IC5 are removed by Q2.

##### 4-6-3 CPU POWER SUPPLY CIRCUIT (LOGIC UNIT)

When the power switch is turned OFF, a voltage is applied to the CPU (IC1) pin 54 via D22 from the lithium backup battery installed in the transceiver to provide backup for the memory contents.

### CPU POWER SUPPLY CIRCUIT

Fig. 10

### 4-6-4 SUBAUDIBLE TONE ENCODER CIRCUIT (MAIN UNIT)

IC3 forms an output expander to convert serial data from the CPU into tone encoder input data.

IC2 is an IC chip for generating subaudible tone frequency signals from 67 Hz~250.3 Hz. The following table shows the relation between input data and the output frequency of IC2.

SUBAUDIBLE TONE ENCODER FREQUENCY TABLE (IC-3210A: U.S.A., AUSTRALIA VERSIONS)

OUTPUT FREQUENCY [Hz]	IC2 INPUT PIN NUMBER						OUTPUT FREQUENCY [Hz]	IC2 INPUT PIN NUMBER						OUTPUT FREQUENCY [Hz]	IC2 INPUT PIN NUMBER					
	8	9	10	11	12	13		8	9	10	11	12	13		8	9	10	11	12	13

\* Screw type      Screw: M2.6×4, etc.      Self-tapping screw: B0 2×4, etc.

Screw's head style    PH: Pan head    FH: Flat head    BuH: Button head

# 5-2 CONNECTOR ASSEMBLY

# SECTION 6 MAINTENANCE AND ADJUSTMENT

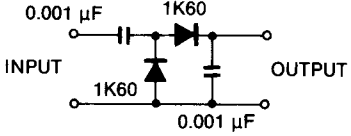

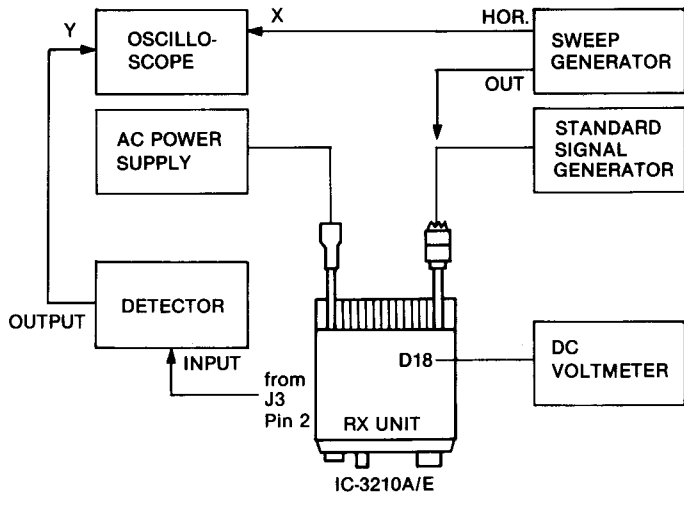

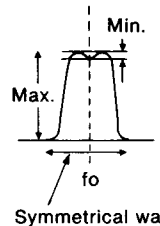

## 6-1 PLL ADJUSTMENT

TEST INSTRUMENTS REQUIRED		MEASUREMENT CONNECTION LOCATION					
(1) AC POWER SUPPLY • Output voltage : 13.8 V DC $\pm$ 15 % • Current capacity : 10 A or more  (2) DC VOLTMETER • Input impedance : 50 k $\Omega$ /DC or better  (3) FREQUENCY COUNTER • Frequency minimum : 500 MHz • Frequency accuracy : $\pm$ 1 ppm or better • Sensitivity : 100 mV or better  (4) RF POWER METER (or 50 $\Omega$ dummy load) • Minimum power rating : 50 W • Frequency minimum : 500 MHz • Input impedance : 50 $\Omega$ • SWR : 1.2:1 or better							
ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT		
		UNIT	LOCATION		UNIT	ADJUST	
LOCK VOLTAGE	1 • Frequency display: 146.000 MHz (IC-3210A) 145.000 MHz (IC-3210E) • Receiving	MAIN	Connect the DC voltmeter to J3 pin 4.	6.8 V (IC-3210A) 6.4 V (IC-3210E)	MAIN (VHF VCO)	L2	
REFERENCE FREQUENCY	1 • Frequency display: 450.000 MHz (U.S.A.) 440.000 MHz (except U.S.A.) • Transmitting	MAIN	Loose couple the frequency counter to the LPF circuit.	450.000 MHz (U.S.A.) 440.000 MHz (except U.S.A.)	MAIN	C102	

### • MAIN UNIT

## 6-2 RECEIVER ADJUSTMENT

TEST INSTRUMENTS REQUIRED		MEASUREMENT CONNECTION LOCATION					
<p>(1) AC POWER SUPPLY</p> <ul style="list-style-type: none"> <li>Output voltage : 13.8 V DC <math>\pm</math> 15 %</li> <li>Current capacity : 10 A or more</li> </ul> <p>(2) STANDARD SIGNAL GENERATOR (SSG)</p> <ul style="list-style-type: none"> <li>Frequency range : 0.1~500 MHz</li> <li>Output level : -127~-17 dBm (0.1 <math>\mu</math>V~32 mV)</li> </ul> <p>(3) DC VOLTMETER</p> <ul style="list-style-type: none"> <li>Input impedance : 50 k<math>\Omega</math>/DC or better</li> </ul> <p>(4) OSCILLOSCOPE</p> <ul style="list-style-type: none"> <li>Frequency range : DC~20 MHz</li> <li>Measuring range : 0.01~10 V</li> </ul> <p>(5) SWEEP GENERATOR</p> <ul style="list-style-type: none"> <li>Frequency range : 0.1~500 MHz</li> <li>Sweep bandwidth : At least 30 MHz</li> <li>Output impedance : 50 <math>\Omega</math></li> </ul> <p>(6) DETECTOR</p> 							
ADJUSTMENT	ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT		
		UNIT	LOCATION		UNIT	ADJUST	
UHF BANDPASS FILTER	1	RX	Connect the oscilloscope to J3 pin 2 via the detector.	Adjust as follows: 	RX	C70 L13 L11 C48	
IF AMP	1	RX	Connect the DC voltmeter to D18 cathode.	Maximum	RX	C48 L3 L2 L1	
NOTE: Adjust the signal generator output level for each time showing the DC voltmeter at 30 % of the lowest range full scale.							
VHF SENSITIVITY	1	RX	Connect the DC voltmeter to D18 cathode.	Maximum	RX	L8 L7 L6 L5	
NOTE: Adjust the signal generator output level for each time showing the DC voltmeter at 30 % of the lowest range full scale.

## SECTION 9 OPTIONAL UNITS

### 9-1 UT-40 TONE SQUELCH UNIT CIRCUIT DESCRIPTION

#### 9-1-1 GENERAL DESCRIPTION

IC1 is a tone encoder/decoder IC chip that outputs and detects 37 different kinds of tones. A tone is set by serial data from IC1 on the LOGIC UNIT in the IC-3210A/E DUAL BAND FM TRANSCEIVER.

IC2 functions as a serial/parallel converter, applying 6-bit parallel data to IC1. The following table shows the relation between frequency and input data in IC1.

OUTPUT FREQUENCY [Hz]	IC1 INPUT PIN NUMBER						OUTPUT FREQUENCY [Hz]	IC1 INPUT PIN NUMBER						OUTPUT FREQUENCY [Hz]	IC1 INPUT PIN NUMBER					
	3	4	5	6	7	8		3	4	5	6	7	8		3	4	5	6	7	8
67.0	H	L	H	H	H	L	110.9	H	L	H	L	H	H	173.8	L	L	L	H	L	H
71.9	L	L	H	H	H	L	114.8	L	L	H	L	H	H	179.9	H	H	H	L	L	H
74.4	H	H	L	H	H	L	118.8	H	H	L	L	H	H	186.2	L	H	H	L	L	H
77.0	L	H	L	H	H	L	123.0	L	H	L	L	H	H	192.8	H	L	H	L	L	H
79.7	H	L	L	H	H	L	127.3	H	L	L	L	H	H	203.5	L	L	H	L	L	H
82.5	L	L	L	H	H	L	131.8	L	L	L	L	H	H	210.7	H	H	L	L	L	H
85.4	H	H	H	L	H	L	136.5	H	H	H	H	L	H	218.1	L	H	L	L	L	H
88.5	L	H	H	L	H	L	141.3	L	H	H	H	L	H	225.7	H	L	L	L	L	H
91.5	H	L	H	L	H	L	146.2	H	L	H	H	L	H	233.6	L	L	L	L	L	H
94.8	H	L	L	H	H	H	151.4	L	L	H	H	L	H	241.8	H	H	H	H	H	L
100.0	L	L	L	H	H	H	156.7	H	H	L	H	L	H	250.3	L	H	H	H	H	L
103.5	H	H	H	L	H	H	162.2	L	H	L	H	L	H	—	—	—	—	—	—	—
107.2	L	H	H	L	H	H	167.9	H	L	L	H	L	H	—	—	—	—	—	—	—

H: HIGH L: LOW

#### 9-1-2 ENCODER CIRCUIT

Pin 26 in IC1 outputs a programmed tone frequency when pin 12 in IC1 becomes "L."

Q4 functions as a buffer amplifier. The collector of Q4 outputs the tone signal and the signal is applied to the VCO circuit to be modulated.

Tone deviation can be adjusted by R10.

#### 9-1-3 DECODER CIRCUIT

Detected signals from pin 9 in IC1 on the RX UNIT of the IC-3210A/E are applied to pin 29 in IC1 on the UT-40 through the DETO line. When the signals have a tone modulated and the tone is matched with the programmed tone frequency by IC2, pin 23 in IC1 changes from "LOW" to "HIGH."

- When the tone squelch function is turned OFF:

Both pins 11 and 12 in IC2 are "HIGH" and +5 V are not applied to IC1. Q2 and Q3 turn OFF and the TSQL line is "HIGH."

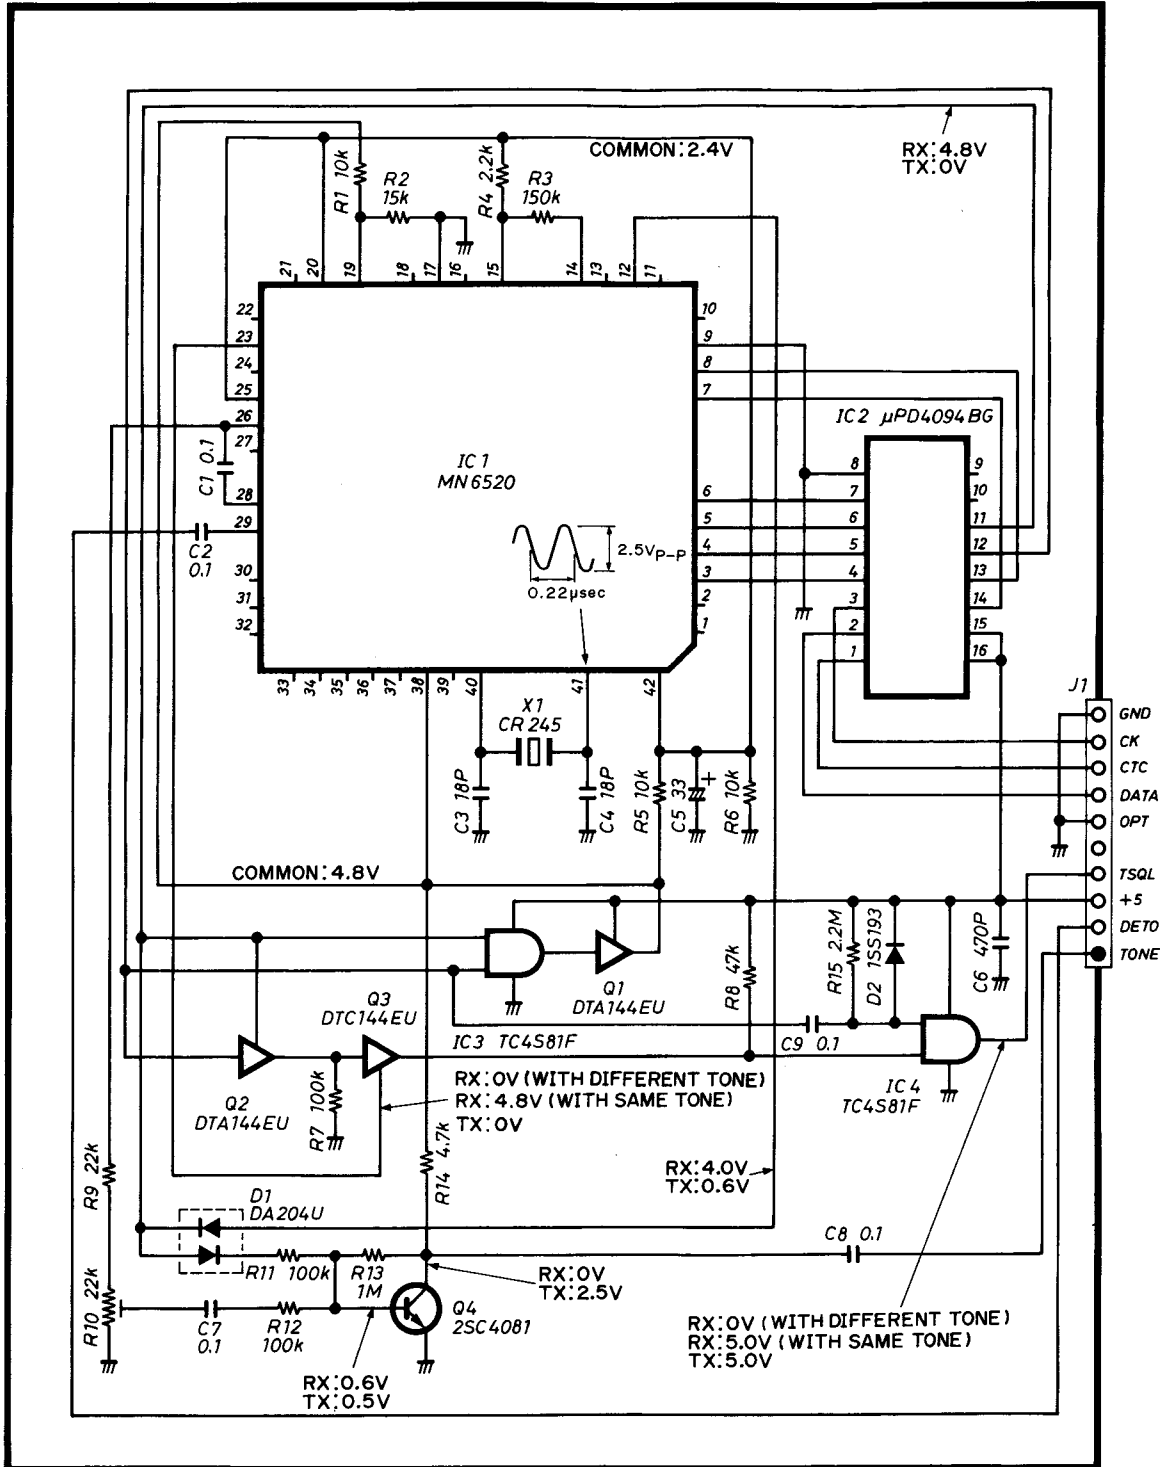

- When the tone squelch function is turned ON:

Pin 11 of IC2 is "HIGH" and pin 12 of IC2 is "LOW." Both Q2 and Q3 turn ON.

When the received tone frequency is not matched with the programmed tone frequency, pin 23 of IC1 is "LOW" and the TSQL line is "LOW."

When the received tone frequency is matched with the programmed tone, pin 23 becomes "HIGH" and the TSQL line becomes "HIGH."
