

# SERVICE MANUAL

AT-120

HF AUTOMATIC ANTENNA TUNER

ICOM INCORPORATED

## **FOREWORD**

The AT-120 HF AUTOMATIC ANTENNA TUNER was developed using both current commercial communications technology and ICOM's own advanced, state-of-the-art computer technology. It was designed primarily to be used with the IC-M700 series HF SSB TRANSCEIVERS.

## ASSISTANCE

Two separate versions of the AT-120 have been designed for use in the GENERAL and FRANCE: the AT-120 and AT-120E, respectively. The AT-120E is designed for use with the IC-M700/F HF SSB TRANSCEIVER and it has a separated emagency tuner.

This service manual covers both versions.

When using the manual the models can be referred to by the following assigned version numbers:

#01: AT-120 (GENERAL version) #02: AT-120E (FRANCE version)

"AT-120" refers to both AT-120 and AT-120E in the text unless a note is used to specifically describe a feature of the AT-120E (#02).

If you require assistance or information regarding the operation and capabilities of these automatic antenna tuners, please contact your nearest authorized ICOM Dealer or ICOM Service Center.

## SECTION 1 SPECIFICATIONS

Number of Semiconductors : Transistors 13

ICs 19 (CPU included)

Diodes 38 (#01), 43 (#02)

Frequency Range : 2MHz~24MHz

Power Capability : 150W PEP

100W continuous

Input Impedance :  $50\Omega$ 

Tune-up Power : 5~15₩

Tune-up Time : Typically 2 to 3 seconds

Matching Accuracy (VSWR) : Less than 2.0

Antenna Required : Marconi-type with suitable RF ground

(More than 23 feet suggested)

Power Supply Required : 13.6V DC (negative ground)

2A maximum (supplied by the IC-M700)

Usable Temperature Range :  $-30^{\circ}\text{C} \sim +60^{\circ}\text{C}$ 

Dimensions :  $230 \text{ mm(W)} \times 340 \text{ mm(D)} \times 80 \text{ mm(H)}$ 

Case Construction : Weatherproof

Weight : 2.4kg (#01), 2.6kg (#02)

Control Cable : AWG 14×4 conductors

## SECTION 2 INSIDE VIEWS

## **TOP VIEW**

## SIDE VIEW

## 4-1 UNPACKING

Carefully remove your tuner from the packing carton and examine it for signs of shipping damage. Notify the delivering carrier or dealer immediately, stating full details, should any damage be apparent. We recommend you keep the shipping carton for storing, moving or reshipping the tuner if necessary. Accessory hardware, cables, etc. are packed with the tuner. Make sure you have removed all equipment and parts before discarding the packing carton.

## 4-2 PLANNING

Select a location for the AT-120 where it will not be disturbed. Avoid long cable runs to the antenna and power source. Also, keep the cables as far from electrical pumps and other electrical apparatus as possible. In particular, do not run the cables near magnetic compasses or electronic instruments.

## 4-3 TUNER INSTALLATION

## 4-3-1 INSTALLATION RECOMMENDATIONS

(1) Install the AT-120 on the deck or in the cabin near the antenna element base as shown in the figure. Try to install the tuner as close to an electrical ground as possible.

(2) Attach the AT-120 either horizontally or vertically with one of the water drain screws down ward. See page 2-1 for location of water drain screws.

- (4) Clamp the coaxial cable between the tuner and your transceiver to the antenna mast to prevent the weight of the cable from pulling on the AT-120.
- (5) The antenna element length should be more than 7 meters (23 feet) to achieve full performance from the IC-M700/AT-120 system. Certain lengths should be avoided since they are difficult for the system to tune. Final SWR, in these cases, may be too high for efficient operation and tuning may take longer.

Note the formula below:

L: Element length to be avoided

L (meters) = 
$$\frac{300}{\text{Operating frequency (MHz)}} \times \frac{1}{2} \times \frac{\text{Integer}}{(1, 2, ....)}$$

(Example)

Operating frequency: 2.182 MHz (2182 kHz)

$$L = \frac{300}{2.182} \times \frac{1}{2} \times 1$$
  
= 68.7 meters

## 4-3-2 INSTALLATION

Three kinds of installation are available for any type of ship.

- Installation by U-clamps
- · Installation by self-tapping screws
- Installation by hex head screws

(3) Remove the downward-facing drain screw to provide an escape path for trapped moisture.
4 — 1

- (1) Test the AT-120 to ensure it is operational before attempting to mount it permanently.
- (2) Attach the AT-120 to its mounting structure using the supplied hardware. Use the correct hardware for your installation location. See the figure below.

- (3) The U-clamp mounting hardware fits 32 to 64mm (1-1/4 to 2-1/2 inch) tubing. Antenna mast diameters outside this range require different hardware. This hardware is not supplied with the AT-120.
- (4) PL-259 coaxial connectors are not supplied with the AT-120. Obtain the correct connectors for the type of cable you are using in your installation. The following procedure illustrates the proper method for attaching the connectors.

NOTE: Refer to SECTION 4-3-3 before attaching the connectors.

#### **■ SOLDERING PL-259**

#### 4-3-3 COAXIAL CABLE CONNECTION

- (1) Prepare the coaxial cable and the two PL-259 connectors you intend to use.
  - Recommended coaxial cable: RG-8/U
- (2) Insert one end of the coaxial cable through the hole with the plastic grommet located on one end of the AT-120 cover. Install the two connectors on the ends of the cable.
- (3) Tighten the screw on the outside of the grommet to prevent water from entering the unit. This also acts as a strain relief for the cable.

Fig. 4

#### 4-3-4 CONTROL CABLE CONNECTION

- (1) Prepare the control cable and the four-pin connector that joins the AT-120 to the IC-M700. The connector and pins are supplied with the IC-M700.
- (2) Strip both ends of the cable as shown in the fugure.

Control cable: AWG 14×4 conductors

Fig. 5

- (3) Solder or crimp the pins onto each wire. Insert the pins into the plastic connector. Feed the other end of the cable through the hole on the end of the main body of the AT-120 with the plastic grommet as shown.
- (4) Make sure the wires do not touch any adjacent parts or metal objects.

#### ■ TERMINAL DESCRIPTIONS

• J8 (#01) E Ground

J8 (#02) ANTENNA CURRENT OUTPUT [ANTC]

Outputs the detected voltage of the RE

Outputs the detected voltage of the RF output power for application to the antenna current meter.

- •J9 POWER SOURCE INPUT [13.6V]
  Inputs 13.6V with a 2A power source.
- START INPUT [START]

  Inputs the tuning start signal. Normally this terminal should be approximately 6V. The AT-120 should be 0V for more than 200 msec. when starting.
- KEY OUTPUT [KEY]

  This terminal is an open collector.
  When the tuning start signal is received, the terminal is at a "LOW" level and the transceiver transmits 10W of checking power until the antenna tuner finds the lowest SWR condition.

#### **■** CONNECTIONS

#### 4-3-5 REPLACING THE COVER

- (1) After making all other connections, connect the PL-259 plug into the SO-239 jack on the TUNER UNIT.
- (2) Confirm that the cover gasket makes good contact with the body and the cover for a water-tight seal.
- (3) Fit the cover onto the base and fasten it with 10 screws as illustrated in the figure.
- (4) Tighten the screws on the cable retainers.
- (5) The AT-120 is now ready for final installation aboard your vessel.

Fig. 7

#### 4-3-6 GROUND SYSTEM

- (1) The AT-120 must be connected to a good electrical ground. A good ground prevents shocks, interference and numerous other problems. One example of a good ground is the nearest metal member on a metal vessel. For best results, use the heaviest gauge wire or metal strap available. Make the length of wire as short as possible.
- (2) Good ground systems on wood or fiberglass boats are more difficult to install. For best results, use a heavy gauge wire or strap connected to the engine block or another large metal object. This may be adequate for operation on frequencies in the 2 to 4MHz range.

Install a counterpoise for each band of frequencies used above 4MHz, as shown in the figure.

NOTE 1: Insulate the ends of each counterpoise from other metal objects.

NOTE 2: Lay out the wires horizontally and as straight as possible.

## 4-3-7 CABLE CONNECTIONS

- (1) Connect the control cable to the ANTENNA TUNER CONNECTOR on the rear panel of the IC-M700 as shown in the figure.
- (2) Connect the antenna coaxial cable to the ANTENNA CONNECTOR.
- (3) Route the cables as planned earlier.
- (4) The antenna element or wire from the RF output terminal on the transceiver must be insulated from other metal objects.
- (5) The IC-M700 provides the necessary connector to output or input control signals to an automatic antenna tuner. Internal switches select the control signal levels; therefore, most existing antenna tuners may be used.

CAUTION: Avoid long cable runs to the antenna and power source. Also, keep the cables as far as possible from electrical pumps and other electrical equipment possible. In particular, do not run the cables near magnetic compasses or electronic instruments.

## SECTION 5 PRE-OPERATIONS

## 5-1 SETTING FOR PRESET TUNING

WARNING: Before setting PRESET TUNING, connect and ground the AT-120 and IC-M700 to an antenna to prevent electrical accidents.

(1) Connect the SWR meter between the IC-M700 and AT-120 as shown in Fig. 1.

- (2) Be sure the S1 PRESET SWITCH on the AT-120 is set in the [NORMAL] position.
- (3) Set the IC-M700 to your most used channel.
- (4) Push the TUNE SWITCH of the IC-M700 to tune the AT-120. Be sure the SWR reading is less than 1:2.0.
- (5) Make a note of which LED lights up on the AT-120.
- (6) Set S1 on the AT-120 to the [PRESET] position.
- (7) Set S2, S3 and S4 at the same location where the LED lights up.

S2: L1~L5 S3: L6~L10 S4: C1~C8

(8) After the above settings are complete, set S1 to the [NORMAL] position.

## 5-2 SETTING FOR MANUAL TUNING (#02)

MANUAL TUNING operates when the GROUP SWITCH on the IC-M700/F is set in the [2182] position.

WARNING: Before setting MANUAL TUNING, connect and ground the AT-120E and IC-M700/F to an antenna to prevent electrical accidents.

- (1) Connect the SWR METER between IC-M700/F and AT-120E as shown in Fig. 1.
- (2) Set the GROUP SWITCH on the IC-M700/F to the [2182] position.
- (3) Remove the wire from J9 and tape the ends of the wire.

CAUTION: DO NOT short the wire by letting it touch other parts of the AT-120E. This wire is a 13.6V power source from the IC-M700/F.

(4) Unplug J2 and rotate C8 counterclockwise at least 3 full turns.

CAUTION: Damage to the AT-120E could occur if the GROUP SWITCH on the IC-M700/F is not set in the [2182] position. Set the GROUP SWITCH in the 2182 position.

(5) See the SWR meter and ground J11 below 5 seconds to transmit 10W of checking power.

CAUTION: To avoid damage to the IC-M700/F, do not transmit more than 5 seconds on each check transmission.

(6) Adjust as follows to obtain a minimum SWR reading with a check transmission:

WARNING: To avoid electric accidents, do not transmit while making adjustments.

CAUTION: The location for connecting the red wire in step (a) below is shown in Fig. 4. Use of an improper location could result in fire risk.

⑤ Connect P5 (red wire) to any of pins J7 through J22. (b) Arrange the configuration of J2 into any of the combinations below (See Fig. 5).

- @ Adjust C8.
- @ Readjust steps 1 and 3 until the SWR reading is less than 1: 1.5.
- (7) After obtaining the minimum SWR reading, reconnect the wire to J9.

#### SECTION 6 CIRCUIT DESCRIPTION

#### 6-1 GENERAL

An 8-bit microprocessor controls the AT-120. The tuner matches the antenna system to the transceiver by using four kinds of detector circuits. These circuits are:

- (1) FORWARD POWER DETECTOR
- (2) SWR DETECTOR
- (3) PHASE DETECTOR
- (4) IMPEDANCE DETECTOR

Detailed descriptions of each circuit follows.

Fig. 1

# 6-2 FORWARD (FWD) POWER DETECTOR CIRCUIT

This circuit ensures the input power from the transceiver is low enough to be handled by the attenuator within the tuner.

On the TUNER UNIT, L1 and D1 detects the RF input current. C1 and C2 divide the detected voltage and feed it to IC14a through CP1.

If the input terminal receives an appropriate power (about 10W or less), the CP2 voltage is LOW and the CPU allows the tuning function.

If power that is too high appears at the input terminal (much greater than 10W), the CP2 voltage stays HIGH and the CPU does not respond.

Fig. 2

Fig. 3

#### 6-3 SWR DETECTOR CIRCUIT

The reflected power from the antenna system provides a detection voltage.

The voltage doubler, consisting of D12 and D13, rectifies this voltage and passes it to comparators IC16a, IC16b and IC17b through the voltage divider formed by R69, R70 and R71.

These SWR data from the comparator chips feed into IC1, the CPU. The CPU controls the setting of the coils and capacitors in the matching network.

Fig. 4

#### 6-4 PHASE DETECTOR CIRCUIT

This circuit consists of L2, L3 and IC18. The phase detector's purpose is to detect reactance components and provide a pure resistance.

The output of IC18 is a reference voltage of approximately 4V when the load of L3 is a pure resistance with no reactance. An inductive load produces an output voltage from IC18 which is lower than the reference voltage, whereas, a capacitive load produces an output voltage higher than the reference voltage. IC17a amplifies the output voltage and passes it to comparator IC15a. The CP14 voltage is LOW level with an inductive load and HIGH level with a capacitive load.

Fig. 5

#### 6-5 IMPEDANCE DETECTOR CIRCUIT

The tuner uses an attenuator to reduce the transmit power to a very low level. The low power minimizes the risk of interference to other stations while matching an antenna to the transmitter.

The VSWR at the input terminal is usually close to 1:1 even with a large change of impedance at the attenuator output due to the 16dB of isolation between the input and the matching network.

The circuit uses the constant voltage at D8 and D9 on the TUNER unit as a reference. If the impedance of the attenuator output is higher than  $50\Omega$ , the detected voltage by D10 and D11 is HIGH. If the impedance is lower than  $50\Omega$ , the voltage is LOW. Both the reference and detected voltages feed to comparator IC15b.

The CP15 voltage is HIGH if the output impedance is lower than  $50\Omega$ , and LOW if the impedance is higher than  $50\Omega$ .

Fig. 6

#### 6-6 LOGIC CIRCUIT

IC1, the CPU, controls the antenna matching network. The CPU receives +5V through Q1, Q2 and IC7 when DC power is applied to the tuner. This voltage initializes the CPU. The ALE signal from the CPU then transfers the program address from the CPU into IC3. The stored program in the Read Only Memory (ROM) IC2 sets each relay to the initial condition.

The tuning program begins only if the START line is at LOW level. RL1 and RL2 activate when RF power at the input antenna connector from the transceiver is present at an appropriate level (See Section 6-2).

The data from the previously described detectors (input RF power, reflected RF power, phase difference, impedance difference) feed into the CPU through buffer IC8. The coil data then passes to IC4, the capacitor data to IC5 and the control data to IC6 according to the tuning program.

The CPU halts when all of the above procedures are complete. The CPU oscillator also stops to avoid causing interference to the receiver.

#### 6-7 LED CIRCUIT (LED UNIT)

The LEDs display the status of the relays. A LED lights whenever its associated relay turns ON. The activated relay connects a coil or capacitor into the tuning circuit.

The LED unit may be removed from the AT-120 to save power, if desired, since the display is for monitoring purposes only.

# 6-8 ANTENNA CURRENT DETECTOR CIRCUIT (MANUAL UNIT: #02)

On the MANUAL UNIT, L319 detects the antenna current. D305 rectifies the detected voltage and feed it to J301 through low-pass filter comprising R305, C305 and C306.

Fig. 7

#### SECTION 7 MAINTENANCE AND ADJUSTMENT

#### 7-1 PREPARATION BEFORE SERVICING

- 1. DO NOT short circuit components while making adjustments.
- 2. Use an insulated tuning tool for all adjustments.
- 3. DO NOT force any of the variable components. Tune them slowly and smoothly.
- 4. Follow the instructions exactly. If an indicated result is not obtained, repeat the instruction until the correct result is obtained.
- 5. Check the condition of connectors, solder joints and screws when adjustments are complete. Confirm that components do not touch each other.
- 6. Confirm defective operation of the antenna tuner first when checking an out-of-service unit.
- 7. Use the correct tools and test equipment.
- 8. To remove the cover of the antenna tuner, remove 10 screws as shown in Fig. 1.

- 9. Connect test equipments as shown in Fig. 2.
- Re-check for the suspected malfunction with the POWER SWITCH ON.
- 11. Check the defective circuit. Measure the DC voltages of the collector, base and emitter of each transistor.

## 7-2 ANTENNA TUNER ADJUSTMENT

After adjustment, reconnect the portion of R131 cut in step 1 and set S1 to [NORMAL] position.
