Table 3 Main and sub IF frequencies

#### **Circuit Configuration by Band**

The TS-790A/E is a "triple bander". It's design implements the capability to receive on any two of the three bands at the same time.

TS-790A/E

The TS-790A/E an RF unit, a final unit, and a PLL unit for each band. Input to the IF unit is switched to the main or sub-band circuitry. The main and sub IF frequencies differ by 100kHz to prevent interference. The sub band IF circuit is only capable of reception, while the main IF circuit is capable of both transmission and reception.

#### 144MHz-band block

The 144MHz-band uses single conversion techniques (in SSB or CW mode). The 1st HET oscillator converts to the main IF of 10.695MHz. If the sub IF is set to 144MHz, the 1st HET operates at a 100kHz higher frequency and makes conversion to the sub IF of 10.595MHz.

#### 430 MHz-band block

The 430MHz-band uses double conversion techniques (in SSB or CW mode). The 1st HET makes conversion to a 1st IF of 75.925MHz. Since the 1st IF is used to generate both the main and sub band IF frequencies the 1st HET oscillator operates at the same frequency, regardless of which IF, main or sub, is to be generated. The 2nd IF is the same as the 1st IF used in the 144MHz-band block. The 2nd HET operates at 65.23MHz for the main IF, or at 65.33MHz for the sub band IF.

### **CIRCUIT DESCRIPTION**

#### 1200 MHz-band block

The 1200MHz-band uses triple conversion techniques (in SSBor CW mode). The 1st HET oscillator signal is used to select the main band or sub band IF circuit. The frequency of the HET output, from the PLL unit, differs by 50kHz from the original frequency. It is then doubled by the RF unit to produce a frequency difference of 100kHz. The 2nd HET oscillator signal operates at a local frequency obtained by multiplying 10.24MHz by 24, and the 3rd HET oscillator signal operates at a frequency obtained by multiplying 10.24MHz by three.

#### CAR circuit configuration

There are two different CAR frequencies used by the IF unit: one for the main IF and one for the sub IF. These frequencies are generated by the PLL unit. The main and sub IF frequencies differ by 100kHz. For normal IF shift functions, a CAR frequency is supplied to the PLL unit for mixing. In addition to this loop, the TS-790A/E has a different PLL loop to generate the CAR frequency. Therefore, separate PLL circuits are provided for the CAR and the HET signals. (Microcomputer-output data for the CAR and HET PLL is changed at the same time.)

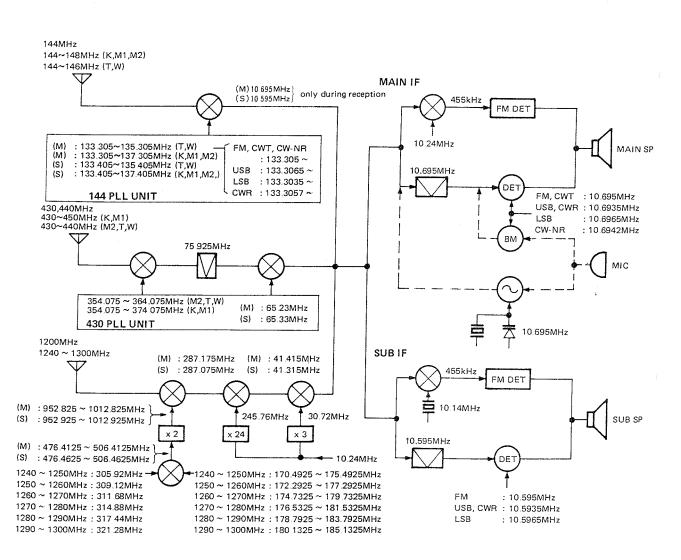

Fig. 1 Circuit configuration by band

### **CIRCUIT DESCRIPTION**

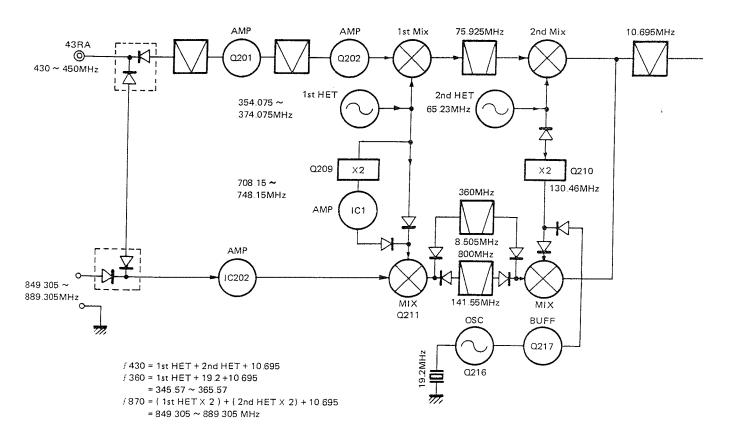

Fig. 3 430MHz RF unit configuration

## **CIRCUIT DESCRIPTION**

#### **Analog Signaling System**

The TS-790A/E is an all-mode triple bander. It has a different system configuration from the usual mono-band radio in order to implement the capability of simultaneous reception on any two bands.

There are two displays main and sub. The main unit acts as a transceiver and the sub unit acts as a receiver. Therefore, the TS-790A/E basically has three front-ends (for 144, 430, and 1200MHz) and two IF circuits (main and sub). The two IF circuits are mounted on a single PC board. The main circuit contains the transmitter circuitry.

Figure 4 shows the receive signal flow. Figure 5 shows the transmitter signal flow. In the 144 or 430MHz-band mode, the appropriate RF unit is connected to the IF unit

with an 10 695MHz (main) or 10.595MHz (sub) signal. In the 1200MHz-band mode, the final mixer (used in SSB or CW mode) is contained on the IF unit. Therefore, the RF unit is connected to the IF unit via a 41.415MHz (main) or 41.315MHz (sub) signal.

Figure 6 shows how control signals are generated to select the desired front-ends and select the proper connections to the main or sub IF circuits. This control method may seem redundant, but, if only five control signals (three for band selection and two for main or sub IF selection) were used an additional AND circuit would be needed to produce a signal like 14M. Actually, the six control signals shown in the figure are used directly, or they are combined with other signals such as TXB and RXB.

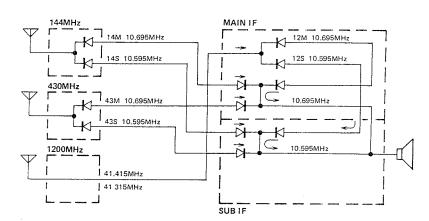

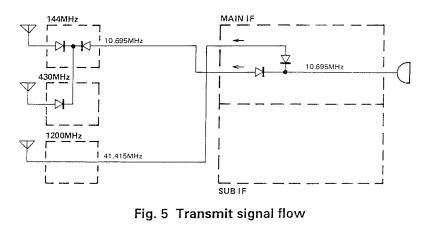

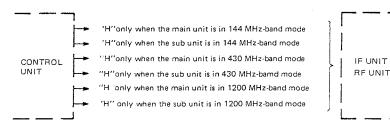

Fig. 4 Received signal flow

#### ·TXB and RXB control circuit for each band

As described above, in order for the appropriate RF unit to be properly connected to the main IF circuit (transceiver) or sub IF circuit (receiver), the TXB and RXB signals, including main or sub band data, are needed in addition to band information. Figure 7 shows the circuit used to generate the information.

Control of 1200MHz-band mode is described below.

## 1. Control when the main unit is operated in the 1200MHz-band

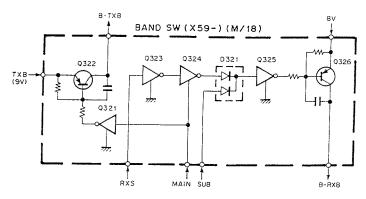

When the main unit is operated in the 1200MHz-band, the 12M signal is H and the 12S signal is L. During receive, the RXS line becomes H, Q323, Q324, D321, Q325, and Q326 turn on sequentially, causing a logic H to be output from B-RXB. In the 1200MHz-band, this H is used as RXB. That is, the B-RXB is generated from 8V. Although Q321 and Q322 are on, B-TXB is not output because TXB is L.

During transmit, TSB becomes H and B-TXB also becomes H. In the1200MHz-band, this B-TXB is used as TXB. Since RXS is L, Q326 turns off and B-RXB also becomes L.

## 2. Control when the sub unit is operated in the 1200MHz-band

When the sub unit is operated in the 1200MHz-band, the 12S signal is H. As a result, Q321 and Q322 turn off, and B-TXB is always L. In addition, D321, Q325, and Q326 are on regardless of the state of RXS, so B-RXB is always H.

Similar circuits are also provided for the 144MHz and 430MHz RF units. They operate in the same way as described for the 1200MHz RF unit.

TS-790A/E

Fig. 7 TXB and RXB control circuit for each band

#### Standby circuit

Figure 8 shows the TXB and RXB generation circuit, which is used regardless of the band in which the TS-790A/E operates. When a PTT or packet transmit request is issued, the signal is sent to the CPU in the control unit through the CSS line of the IF unit. The CPU determines whether transmission is disabled. If it is not disabled, the CPU outputs a H signal from CTX line. This H signal is sent to the 144MHz final unit via Q98 and Q123, turning the SW transistor and then TXB (9V) on. The TXB signal is distributed to the final, IF, and RF units.

RXB is the opposite of the TXB logic. Q95 forms a buffer to minimize TXB leakage from the 8V line. The RXS signal has a time constant determined by an electrolytic capacitor connected to the base of Q97. The band switching module uses the signal to generate B-RXB. RXB generated by Q96 cannot be used as a band switching signal due to the time constant, which is determined by many decoupling circuits contained in the circuit following Q96

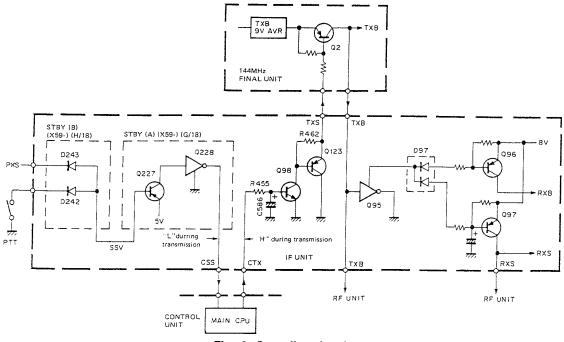

Fig. 8 Standby circuit

### **CIRCUIT DESCRIPTION**

#### Keying circuit

The TS-790A/E uses semi break-in CW keying. Traditionally, the time constant was determined by an electrolytic capacitor or timer IC. In the TS-790A/E, the time constant is controlled by an A/D convertor inside the CPU.

For information on STBY(A) (X59-)(G/18), see the description of module operations. Q22 and Q23 form a switch used to disconnect VR11 from the DL2 line when the TS-790A/E operates in a mode other than CW mode.

In the 144 or 430MHz-band, actual keying operations are done by the drain from the final TIF amplifier and the diode switch. In the 1200MHz-band, it is done by a mixer converting the 10.695MHz drain from the final TIF amplifier to 41.415MHz and an input signal to it.

#### ALC and power control circuits

The ALC circuit drives its comparator with a voltage obtained by detecting the standing wave, and using it to generate an ALC voltage. The TS-790A/E power is controlled by changing the threshold voltage of the comparator.

If the power decreases, gain will increase by an amount equal to power decrease. To avoid this, gain is decreased by changing the gate bias of the TIF amplifier, thereby minimizing the amount of ALC loop gain fluctuation due to adjustments of the power control.

When FM or CW is selected from the SSB mode, the power needs to be decreased by approx. 20dB. To do this, Q84 and Q85 are used to change the threshold level.

The RF meter is operated from part of the standing wave detection voltage.

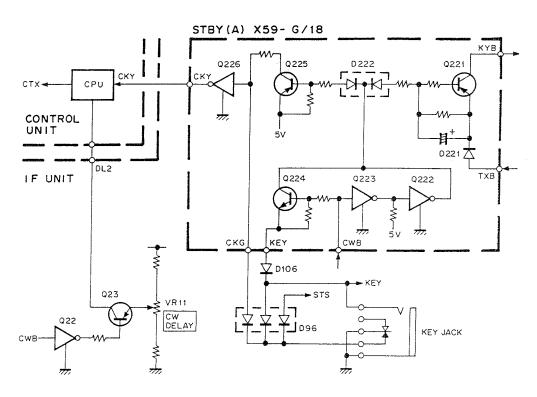

Fig. 9 Keying circuit

#### Squelch circuit

語いた

This section will describe how the squelch circuit in the main unit operates.

When the squelch circuit opens, pin 13 of IC8 becomes H. The output voltage from the pin turns on Q181a and Q181b in the SQL control (X59-)(E2/18). Q131b is used to control the packet busy state. It is turned on/off according to a time constant determined by the IC8 squelch circuit, regardless of mode. IC8 operates in any mode including FM mode to allow all-mode squelch. In the FM mode, C546 is not charged because no voltage is supplied to the collector of Q181a. In modes other than FM, the positive (+) side of the capacitor is charged, closing squelch. As a result, a high-impedance state occurs between the collector and emitter of Q181a, and the C546 dischargs thru Q182. This allows the squelch tail to be lengthened.

Q120 is a switching transistor which negates input to Q182 when the TS-790A/E is switched from the FM mode to SSB or CW mode squelch. This prevents malfunction of Q182 due to a pulse produced by differentiating input to C546 at its leading edge. On/off operation of the audio signal switches Q61's squelch gate circuit and also turns the AF switch Q18 on/off. Q18 removes unnecessary noise during transmission, or when no memory channel is available, or when the TS-790A/E is switched to a different mode Q118 is used to change the switch timing of the squelch gate in FM, SSB, or CW mode. In SSB or CW mode, internal noise is low, so squelch on/off noise will be easily heard when a headphone set is used. To avoid this, the switching interval is made a little longer, as compared with that in FM mode.

TS-790A/E

When the optional CTCSS unit (TS-790A only) is used, the squelch circuit operates as described below.

When the CTCSS unit is turned on, the CT line becomes H and Q14 turns on, turning Q61 off regardless of whether the squelch is open or closed. As a result, the TS-790A enters a state in which no sound is output. When a tone is detected in this state, the DET line from the CTCSS unit becomes H and Q141 turns on, turning Q142 on. Thus, the TS-790A enters a state in which sound can be output. Even if the CTCSS is operating, the busy LED is linked with the state of the squelch, open or close, to allow busy state monitoring.

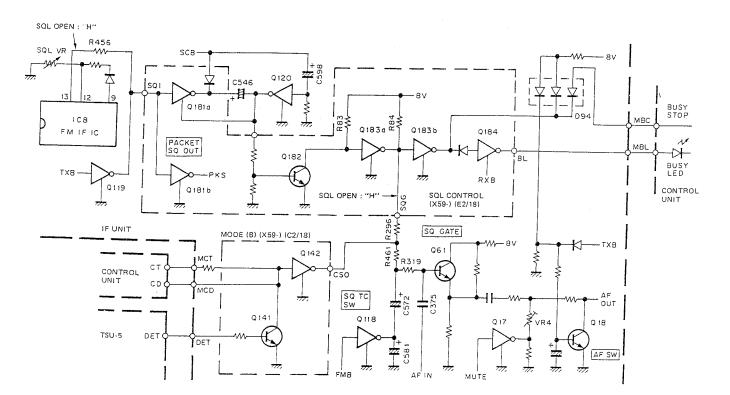

Fig. 10 Squelch circuit

### **CIRCUIT DESCRIPTION**

#### Speaker separate circuit

The speaker separate circuit allows effective use of the simultaneous two-band reception capability. That is, it provides a speaker separate switch and two external speaker terminals. Using the switch and connecting external speaker units, the TS-790A/E can be used in various ways.

When SP SEP is off, IC262a turns on and mixes AF from the main and sub units. Also, IC262b or IC262c turn off when only one EXT. SP terminal is used. In all other cases, both are on.

IC261 consists of a logic circuit which controls the above operations. When SP SEP turns on, Q19 and Q20 go on. They are used to prevent fluctuation of the audio level which will occur when the SP SEP line toggles between on and off.

Q261 is a transistor that is used to convert the 5V signal from the control unit to 8V.

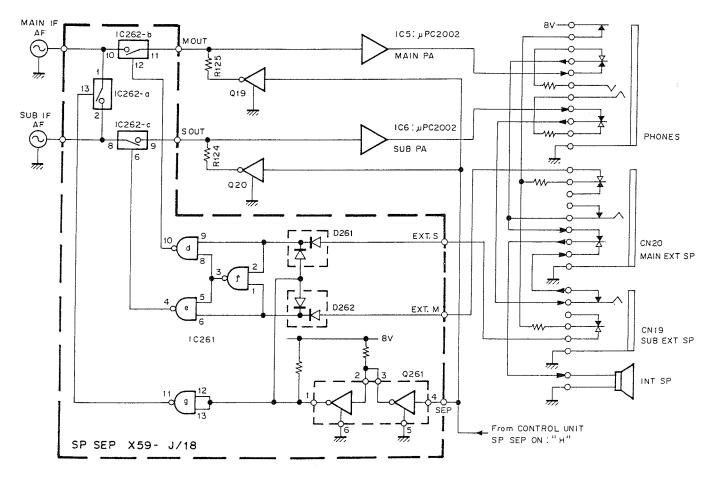

Fig. 11 Speaker separate circuit

## **CIRCUIT DESCRIPTION**

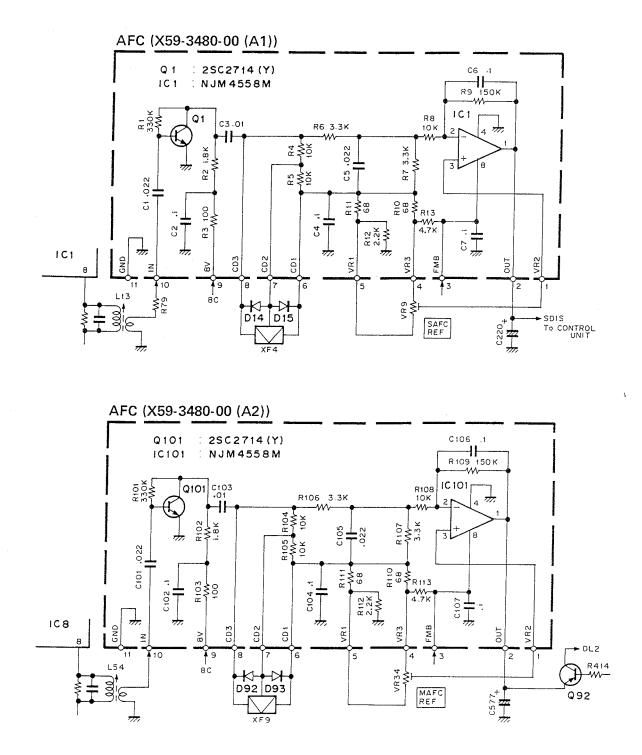

#### Module Unit in the IF Unit • AFC (ALT) module

(The same circuit is used in the main and sub unit.)

The 455kHz signal is amplified by Q1 and then converted to a DC voltage by the ceramic discriminator connected to CD1 thru CD3.

The DC voltage is amplified by IC1 and then sent to an A/D convertor in the control unit.

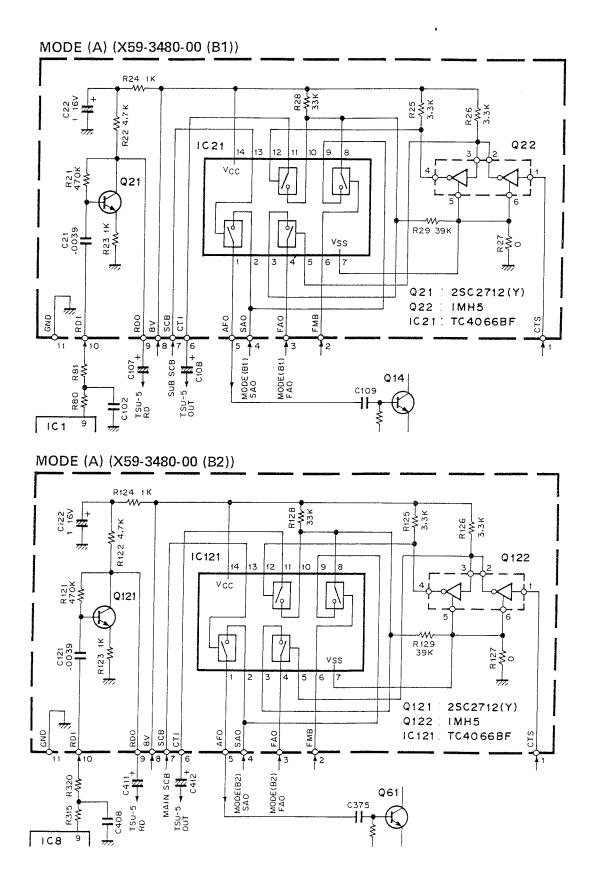

When no signal is present or when the TS-790A/E is tuned, the OUT pin supplies approx. 2.5V. When the TS-790A/E detunes in the range from -3kHz to +3kHz, it outputs a voltage from -3.1V to 1.9V.

## **CIRCUIT DESCRIPTION**

#### • MODE (A) module

(The same circuit is used in the main and sub unit.) Output from the FM detector is amplified by Q21 and then sent to the tone detect pin in the optional CTCSS unit. IC21 is used to switch the AF mode when the TS-790A/ E is in SSB or FM mode. If the optional CTCSS unit is connected, Q22 can be used to switch the output from a HPF in the CTCSS unit to the FM AF line.

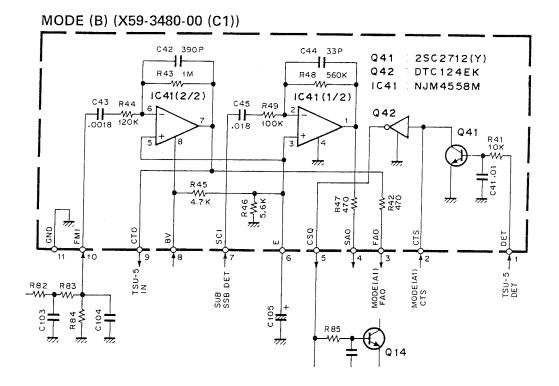

## **TS-790A/E**

#### • MODE (B) module

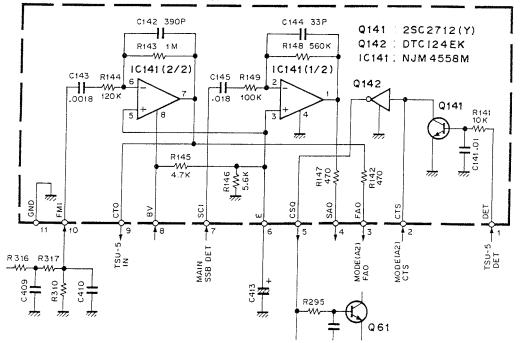

ġ

#### (The same circuit is used in the main and sub unit.)

If the optional CTCSS unit is used, Q41 and Q42 turn the squelch on/off, depending on if the CTCSS unit detected a tone.

#### MODE (B) (X59-3480-00 (C2))

## **CIRCUIT DESCRIPTION**

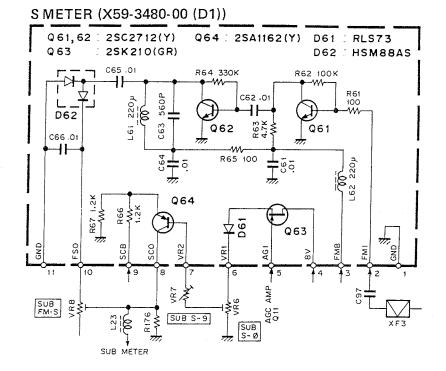

#### S-METER module

#### (The same circuit is used in the main and sub unit.)

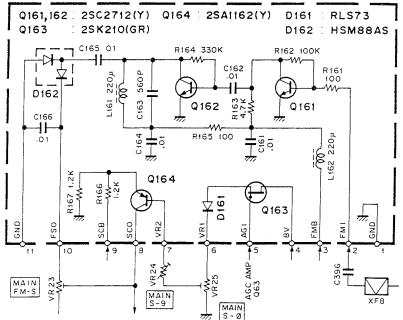

Q61, Q62, and D26 form the FM S-meter circuit, which amplifies and detects a signal from the 455kHz filter.

Q43 and Q64 form a SSB S-meter circuit.

The sub unit uses a digital meter, not an analog meter. The SSB S-meter circuit in the sub unit, therefore, is provided with a load of  $4.7k\Omega$  resistor. Voltage generated by the resistor is controlled and converted from analog to digital.

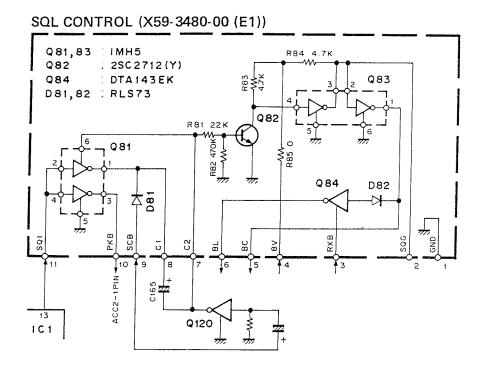

#### S METER (X59-3480-00 (D2))

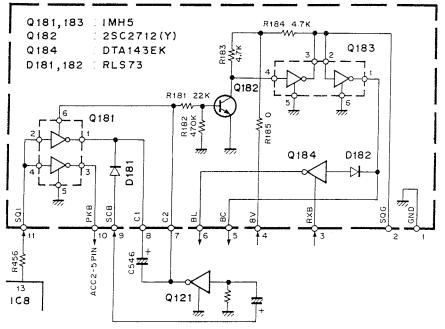

## **CIRCUIT DESCRIPTION**

#### SQL CONTROL module

(The same circuit is used in the main and sub unit.) Q81 send the packet busy control signal to the PKS pin. When the squelch is open, the signal is connected to ground. In SSB or CW mode, the squelch tail is delayed. The BC and BL pins are used to supply the scan stop signal (active L) and the busy LED on signal (active H) to the control unit respectively. The operation of the squelch circuit was described in an earlier section.

#### SQL CONTROL (X59-3480-00 (E2))

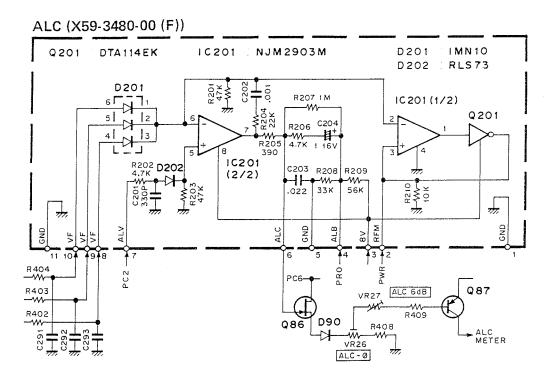

### **CIRCUIT DESCRIPTION**

#### ALC module

The ALC module generates ALC voltage, using the standing wave voltage from the final unit.

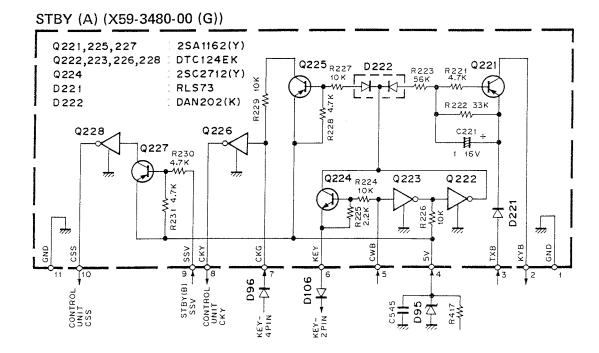

Output voltage from the ALV pin is changed to change the threshold level of the ALC and control power. One half of IC201 acts as a voltage buffer to operate the RF meter.

#### STBY (A) module

Q227 and Q28 sends the TX GO signal (active L) to the control unit when a semi break-in operation occurs in CW mode or when a transmission request, other than a W or T type tone transmission request, (PTT or SS) is generated. The CKY pin is used to send the TX GO signal (active L) to the control unit when a semi break-in key down operation occurs.

The KYB pin is used to supply B voltage having a time constant to the TIF amplifier when a semi break-in key down operation occurs.

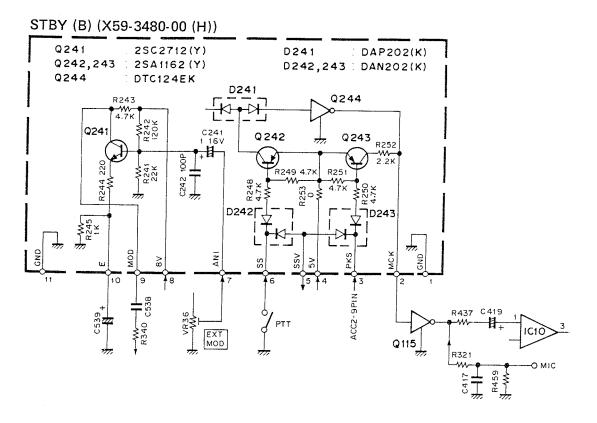

ł

• STBY (B) module Q241 receives and amplifies an external analog modulation signal, and sends the signal to the MIC amplifier. The MCK pin is used to provide a signal which prevents modulation from being caused by input from the MIC when sending the packet standby signal from the PKS pin.

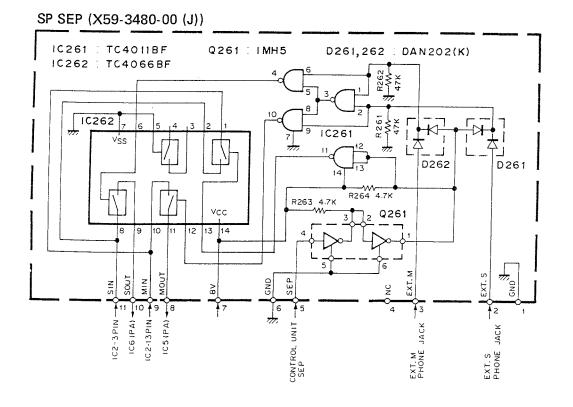

**TS-790A/E** 

#### • SP SEP (Speaker separate) module

The speaker separate module determines which one

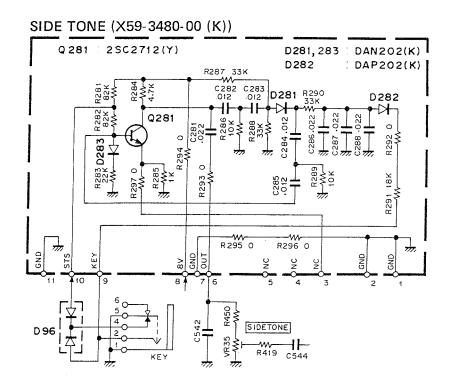

of the two AF PA IC chips supplies AF from the main or sub IF unit.

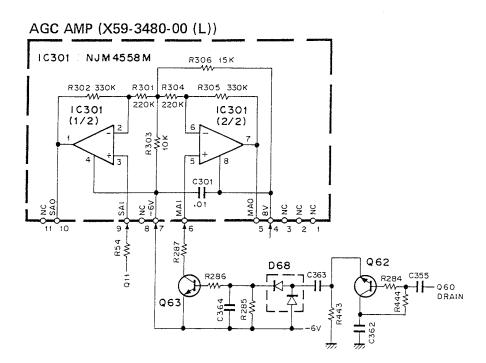

#### SIDETONE module

When a CW key is inserted into the KEY jack, the STS pin is disconnected from ground, and Q281 is ready to operate. When the KEY is closed, the OUT pin emits sidetone.

#### AGC AMP module

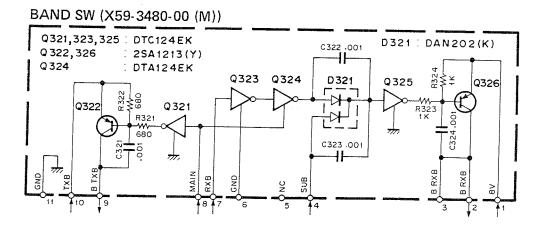

The AGC amplifier module generates negative AGC voltage.

## **TS-790A/E**

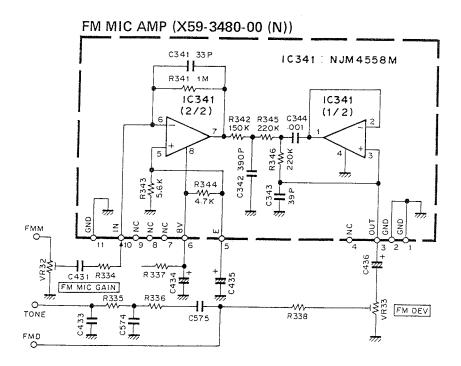

#### BAND SW module

The band switching module generates TXB and RXB for band selection. For example, it generates 14TXB from B-TXB and 43RXB from B-RXB. B-RXB sent to the sub unit does not go off even if the main unit is acting as a transmitter.

#### FM MIC AMP module

IC341 consists of a limiter and a set of LPFs.

## **CIRCUIT DESCRIPTION**

#### **Transmit Frequency Components**

In FM mode, signals from the two 10.695MHz crystal oscillators in the IF unit are dorectly modulated. In the SSB or CW mode, the DSB signal is generated, using BM (Balanced Modulation) from IC9 in the iF unit. Then the 10.695MHz signal for SSB is obtained from filter XF6 (10.695MHz).

| Band<br>IF | 144MHz            | 430MHz            | 1200MHz           |
|------------|-------------------|-------------------|-------------------|

| 3rd  |           |           | 287.175MHz |

Table 5 Transmit IF frequencies

#### **PLL Configuration**

The TS-790A/E contains a dual PLL loop for the 144MHz band, a dual PLL loop and a 2nd HET PLL loop for the 430MHz band, a triple PLL loop for the 1200MHz band, and a pair of main and sub PLL loops, totaling 11 PLL loops, and 11 VCOs.

#### 144MHz-band block PLL configuration

The 144MHz-band block contains a dual PLL loop using a 20Hz step VFO. 78.5 to 82.5MHz generated from loop B for 2kHz comparison is divided by 100 in IC3 to generate the 20Hz step output. The 20Hz step output is mixed with 10.24MHz by IC1 The upper portion of the mixed signal is extracted by ceramic filters CF1 and CF2. The output from the filter is mixed with 102.4MHz obtained by multiplying 10.24MHz by 10 to generate a 113.425 to 113.465MHz signal. These frequencies are used as local oscillator frequencies for loop A.

Loop A makes a 40kHz comparison. Signals from ...s VCO are supplied to the 1st HET. L5, L6, D2, D3, and D4 form a variable low-pass filter (LPF), which is used to remove unnecessary components from output of mixer Q6. Bias voltage to D2, D3, and D4 of the LPF is controlled by IC12 logic, using the 14B1 signal from the control unit and the lock detect signal from loop A, to control its cutoff frequency.

| 14B1 | A loop lock detect | Bias voltage to<br>D2 and D3 | LPF cut-off<br>frequency |
|------|--------------------|------------------------------|--------------------------|
| L    | Unlocked           | ≅ 18V                        | High                     |
| н    | Unlocked           | ≅ 18V                        | High                     |
| L    | Locked             | ≅ 18V                        | . High                   |
| Н    | Locked             | ≅ 1.5V                       | Low                      |

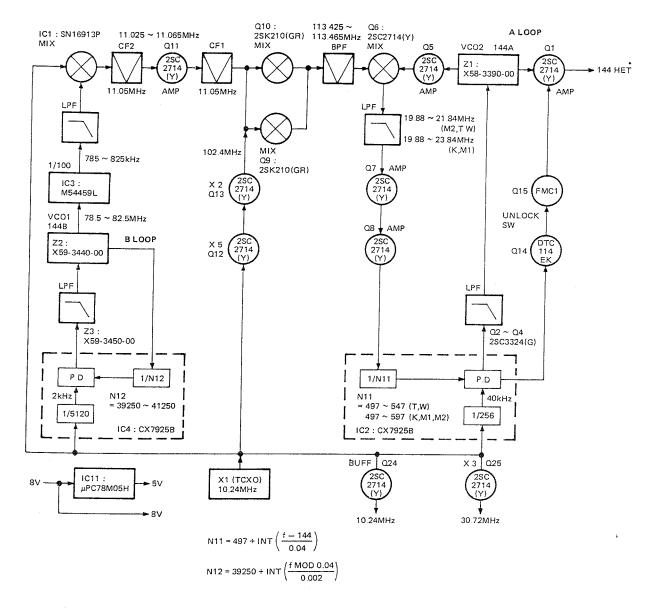

Table 6

The lock detector circuit switches output from piles (AO) of IC2 with Q14 and Q15, and sends unlock information to the Q1 HET amplifier and control unit.

To minimize mutual interference, the 8V power line to each band block is turned off by a switching circuit when it is not used. Each band receives usage information from pin 8 (AO) of the B loop PLL IC chip. The 144MHz PLL uses pin 8 of IC4 to control the switching circuit (Q26 and Q28).

Pin 8 of the PLL IC chip (CX-7925B) can be used to select either lock detect output or general-purpose port. Which to detect is determined by data in the PLL IC when the TS-790A/E power is turned on. The 144MHz PLL sends the IF unit a 10.24MHz local frequency generated by Q24 and a 30.72MHz local frequency generated by Q25 (by multiplying 10.24MHz by three).

## **CIRCUIT DESCRIPTION**

Fig. 12 144MHz PLL block diagram

### **CIRCUIT DESCRIPTION**

#### 430MHz-band block PLL configuration

The 430MHz-band block contains a 20Hz-step triple PLL loop and a 2nd HET PLL loop. 79.5 to 83.5MHz VCO output from the 2kHz loop B is divided by 100 in divider IC53 to generate the 20Hz step output. The 20Hz step signal is mixed with 10.24MHz by IC52. The upper portion of the mixed signal is extracted by ceramic filters CF50 and CF51. The filter output is mixed with 122.88MHz obtained by multiplying 10.24MHz by 12 to generate 133.915 to 133.955MHz. These frequencies are then used as local oscillator frequencies for loop C.

Loop C makes a 40kHz comparison. The frequency of the signal from its VCO varies approx. 2MHz to 3MHz. An output frequency from loop C is used as a local oscillator frequency for loop A. The output frequency is mixed by the DBM (L57, L58, and D51), and then sent to the PLL IC through a BPF. VCO output from loop A is supplied to the 1st HET. Loop A makes a 460kHz comparison. It is supplied with appropriate data according to the value of N21 which varies by 1MHz as shown in Figure 13. Loop C data, therefore, changes in an irregular manner like the VCO23 frequency shown in the table. The graph in Figure 14 illustrates this.

Loop D is the 10kHz-step 2nd HET PLL loop. When the main unit is set to 430MHz, it is locked at 65.23MHz. When the sub unit is set to 430MHz, it is locked at 65.33MHz. The loop is not locked at any other frequency.

The unlock detect circuit OR's output from IC50 in loop A with that from IC55 in the D loop, and switches the OR output, using Q58 and Q59.

8V power to the 430MHz PLL block is obtained by switching output from IC54 with Q74 and Q75.

Fig. 13 430MHz PLL block diagram

### **CIRCUIT DESCRIPTION**

#### 1200MHz-band block PLL configuration

The 1200MHz-band block contains a 10Hz-step triple loop PLL. Since the output frequency from the PLL is doubled by the RF unit, the 20Hz-step VFO is produced in the final stage. 10Hz-step PLL output from loop A is mixed with output from loop C and then passed through a BPF to generate a 500MHz PLL frequency.

Loop B makes a 1kHz comparison. The 1kHz signal is divided by 100 in divider IC2 to generate the 10Hz step output. The other portion of loop B leading to loop A has the same circuit configuration as the 144MHz PLL loop.

Loop C makes a 320kHz comparison. As shown in the table of Figure 15, data supplied to the loop changes each time the frequency varies 10MHz. The frequency of loop C does not vary in regular 5MHz steps (half of the display frequency 10MHz). The sum of C and A loop frequencies varies in 5MHz steps. The loop A lock voltage, therefore, changes like that of loop C in the 430MHz-band block. Mixed A and C loop output is amplified by Q30, Q31, and Q31 for PLL output.

The unlock detect circuit OR's output from IC4 in loop A with that from IC5 in the loop C, and switches the OR output, using Q21, Q21, Q23, and Q24.

Power to the 1200MHz PLL block is obtained by switching output from IC1 with Q74 and Q75.

#### CAR PLL configuration

There are two CAR PLL loops: Main and Sub. The PLL section is contained in the same unit as the 144MHz PLL block. Each loop performs 20Hz step operations. These loops have the same configuration, and they only differ in frequencies handled and PLL data supplied. The main loop is described below.

The main loop makes a 2kHz comparison. The output frequency of 45.5MHz  $\pm$  several-hundred kHz is divided by 100 in IC9 to generate 455kHz  $\pm$  several kHz. The 455kHz signal is mixed with 10.24MHz by IC8. The upper portion of the mixed frequency is extracted by CF4 to generate 10.695MHz  $\pm$  several kHz. The frequency is used as CAR.

In modes other than FM mode, power to the mixer (IC5 and IC8) is supplied by the IF unit through the CAR output coaxial cable. In FM mode, CAR components are not included.

Fig. 15 1200MHz PLL block diagram

**TS-790A/E** 

### **CIRCUIT DESCRIPTION**

#### **Digital Control Circuit**

The TS-790A/E digital block consists of several chips including the main CPU ( $\mu$ PD78C10G-36). It also contains a 32K ROM (27C256A-25), a 8K RAM (TC5564APL-15), and I/O ports (MB89363B and M5M82C55AFP-5), etc., and performs digital control.

The digital control circuit also contains the sub CPU  $(\mu PD75206G-531-1B)$  specially designed for a fluorescent

character display. It allows data to be easily output to the display, using serial data commands. The sub CPU also controls LED, and synthesizes subtones and beeps. It is controlled by commands from the main CPU.

The main CPU contains an A/D convertor and a set of serial ports to allow direct input of analog signals. The TS-790A/E can be controlled by an external personal computer via the IF232C (optional level convertor).

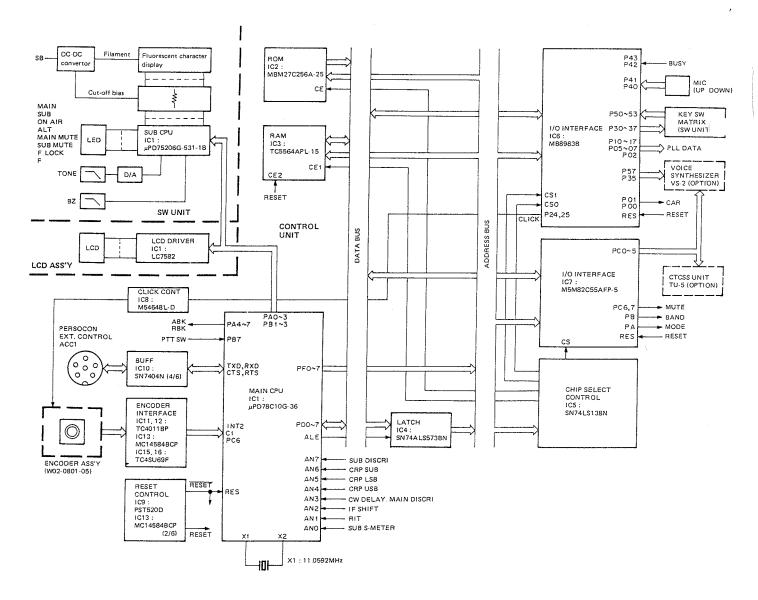

Fig. 17 Digital control block diagram

#### Encoder circuit

The TS-790A/E uses a newly developed optical encoder with detent type tuning (channelized) for easier use. The encoder circuit, therefore, contains an additional encoder waveform shaping circuit and an additional detent drive circuit. The Encoder waveform contains two different signals. One is a two-phase count signal whose phases differs 90 degrees and which contains 250 pulses per rotation. The other is used for the channel lized tuning

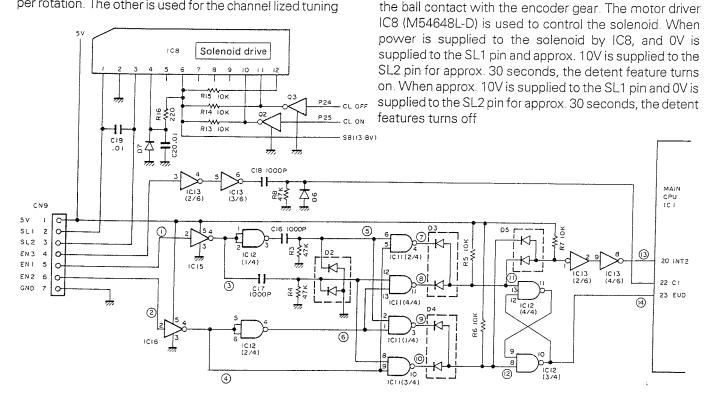

Fig. 18 Encoder waveform shaping, doubling, and solenoid drive circuit

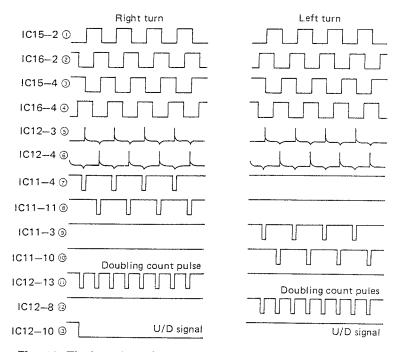

Fig. 19 Timing chart for doubling 250-pulse count signal

27

**TS-790A/E** 

when detent operation occurs and contains 50 pulses per

rotation. The control unit extracts an UP/DOWN direction

signal and a count signal (when no detent or detent

operation occurs) from the two-phase count signal. It then

shapes and sends the signals to the main CPU. The 250-

pulse count signal is doubled before extraction to convert

To perform detent control, a solenoid is used to make

it to 500 pulses per rotation.

### **CIRCUIT DESCRIPTION**

#### System reset circuit

IC9 (PST520) forms the system reset circuit. It monitors source voltage to check whether it is approx. 4.2V or less. If source voltage becomes lower than 4.2V, the circuit sends a reset signal to the main CPU and I/O ports, and generates a back-up of RAM. The TS-790A/E stops operation.

When the TS-790A/E power is turned on and the

source voltage exceeds approx. 4.2V, the reset signal is cleared. Then, after a time constant determined by R1 and C9 elapses, the main CPU and I/O ports are initialized to start operation.

4.2

A

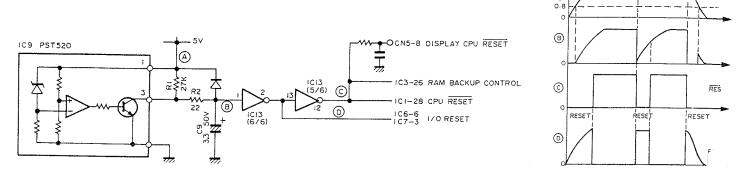

Fig. 20 Reset circuit and timing chart for reset operation

#### Addressing control

PD0 to PD7 from the main CPU form an address and data bus multiplex port, and its PF0 to PF7 are A8 to A15 address signals. The signals, therefore, need to be separated into address and data signals. This is done by the D type latch IC4 (SN74ALS573BN). The A13 to A15 address signals are used as chip select signals by the address decoder IC5 (SN74LS138N) and sent to appropriate IC chips.

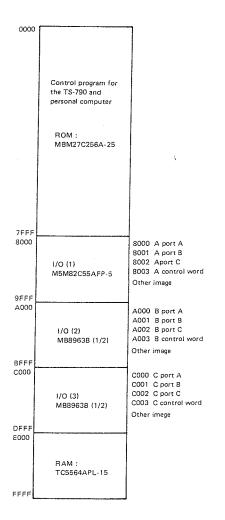

Fig. 22 Memory map

## **CIRCUIT DESCRIPTION**

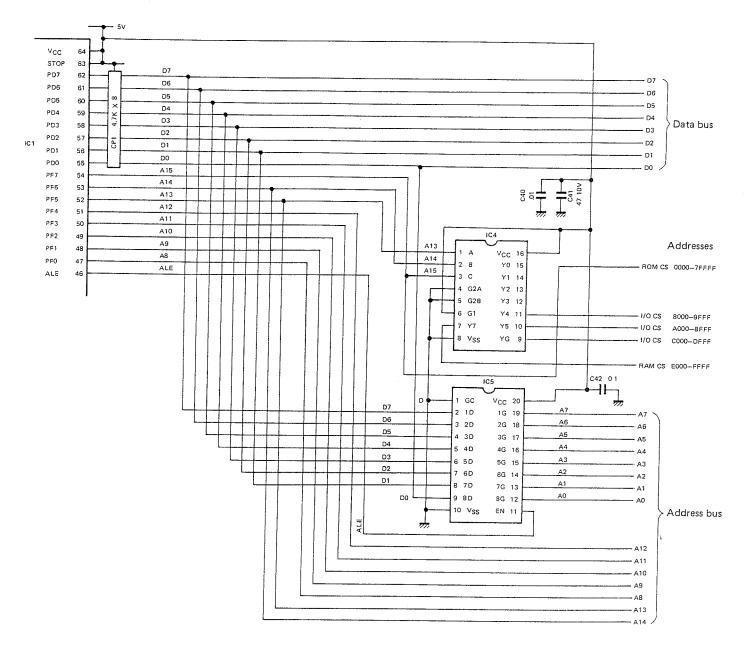

Fig. 21 Address and data separation and address decoder circuits

#### Analog signal input

The main CPU ( $\mu$ PD78C10G-36) contains an A/D convertor to allows direct input of analog signals. Incoming analog signals are internally converted to its corresponding digital values.

| Port | Input signal  |
|------|---|
| ANO  | Sub S meter voltage   |
| AN1  | RIT VR voltage  |
| AN2  | IF shift VR voltage   |
| AN3  | Main discriminator deviation voltage in FM mode,<br>delay VR voltage inCW or CW-N mode. |
| AN4  | USB VR voltage for CAR adjustment   |
| AN5  | LSB VR voltage for CAR adjustment   |
| AN6  | Sub VR voltage for CAR adjustment   |
| AN7  | Sub discriminator deviation voltage   |

Table 7

#### Display data

The fluorescent character display in the main unit is controlled by the 4-bit sub CPU ( $\mu$ PD75206G-531-1B). The control unit simply needs to send serial data to the display.

The liquid crystal display panel in the sub unit has an LCD driver. The control unit, therefore, can drive the LCD simply by sending serial data.

Display data for the main or sub unit is sent to the switching unit via a flat cable. If the data is for the main unit, it is sent to the sub CPU of the switching unit. If the data is for the sub unit, it is sent to the LCD assembly of the switching unit.

#### DC-DC convertor

The DC-DC convertor drives the fluorescent character display. It receives 13.8V at its DC input pin, and outputs 4.9V AC for the display filament and –25V cut-off bias to the display drive circuit.

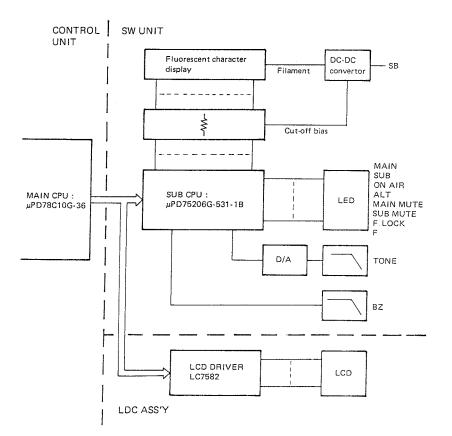

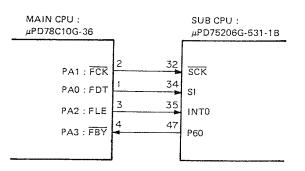

Fig. 23 Display block diagram

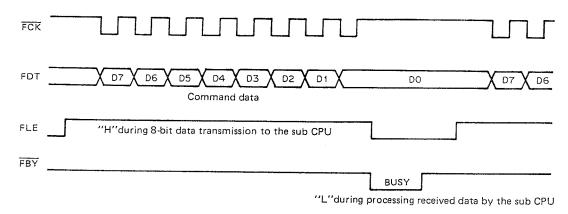

#### Sub CPU

The sub CPU is a 4-bit single-chip microcomputer  $\mu$ PD75206G-531-1B specially designed for control of a fluorescent character display. It reduces load on the main CPU. That is, the main CPU can let the sub CPU control turn-on/off and display scan operations of the fluorescent character display, simply by sending appropriate serial display data to the sub CPU in a command form.

The sub CPU also performs subtone synthesization for the repeat and CTCSS, and beep synthesization for the main and sub units. These operations are also controlled by serial data commands from the main CPU.

#### • PLL data

The TS-790A/E contains two PLL loops for the 144MHz band, three PLL loops for the 430MHz band, three PLL loops for the 1200MHz band, and two PLL loops for CAR, totaling 11 PLL loops.

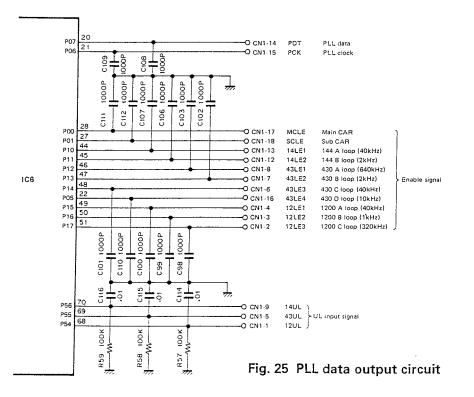

Both of the MB87006 and CX7925B need to be supplied with two types of data, one indicating relative divide ratio and the other indicating divide ratios for the variable dividers. The relative frequency division ratio is output when the TS-790A/E power is turned on, since it does not need to be changed. For the division ratio for the variable divider, The VFO frequency or memory frequency is converted to PLL serial data and then sent to each PLL IC chip.

PLL data for the CX7925B contains a difference between a frequency division ratio value and a division ratio data value: Relative division ratio data value = relative division ratio value - 2 Relative division ratio data value = relative division ratio value - 2 (when the AMI input pin is used) Relative division ratio data value = relative division ratio value - 8 (when the FMI input pin is used) Relative division ratio data value = relative division ratio value - 2 (when the TVI input pin is used)

When the PLL is unlocked, the PLL unit outputs an unlock signal. The control unit detects the unlock signal and reflects the state by switching the display to the dot display mode.

## **CIRCUIT DESCRIPTION**

#### • Key scan

Ports P30 and P50 of IC6 form a key scan matrix. The key scan signal is generated, using a negative pulse from P30, to select a corresponding column in the P50 port, and the switch setting of the column is read. When an intersection in the matrix is sensed, its corresponding bit in the P50 port becomes L. This follows the microprocessor to determine which switch is being pressed. Key chatter is absorbed by software.

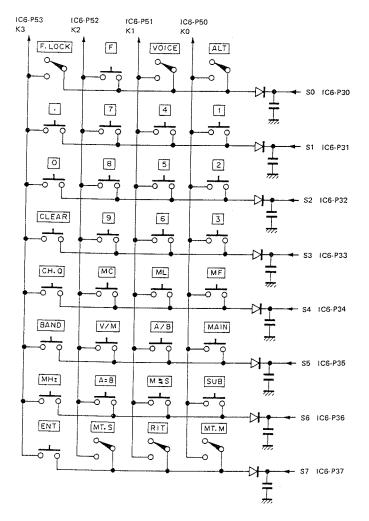

Fig. 26 Key scan matrix

#### Output signals

#### 1. Band signals

| Signal name       | Description   |
|-------------------|---|
| 14M<br>43M<br>12M | Band signals for the main unit. One of these three<br>band signals is active at any given time to indicate<br>to the other units which band block in the main<br>unit is to be selected<br>When these signal are active, they provide approx<br>8V. |
| 14S<br>43S<br>12S | Band signals for the sub unit. One of these three<br>band signals is active at any given time to indicate<br>to the other units what band block in the sub unit<br>is to be selected.<br>When these signal are active, they provide approx<br>8V.   |

#### 2. Mode signals

| Signal name | Description  |
|-------------|--|
| MFMB        | Indicates that the main unit is in FM mode.            |
| MSSB        | Indicates that the main unit is in LSB or USB mode.    |
| MCWB        | Indicates that the main unit is in CW mode.            |
| MCNB        | Indicates that the main unit is in CW-N mode.          |
| SFMB        | Indicates that the sub unit is in FM mode.             |
| SSCB        | Indicates that the sub unit is in LSB, USB or CW mode. |

When these signal are active, they provide approx 8V.

#### 3. Other signals

| Signal name | Description                                  |
|-------------|--|
| CTX         | Active during transmission, active "H".      |
| CRX         | Active during reception, active "H"          |
| МАВК        | Main audio stage blanking signal, active "H" |
| SABK        | Sub audio stage blanking signal, active "H"  |
| MRBK        | Main IF stage blanking signal, active "L"    |
| SRBK        | Sub IF stage blanking signal, active "L"     |
| MCT         | Main CTCSS signal, "H" when on               |
| SCT         | Sub CTCSS signal, "H" when on                |
| MMUT        | Main mute signal, active "H"                 |
| SMUT        | Sub mute signal, active "'H''                |
| VCK<br>VDT  | Data output pin for CTCSS unit (TSU-5).      |
| MEN         | CTCSS unit data enable for main              |
| SEN         | CTCSS unit data enable for sub               |
| SEP         | SP separate signal, "H" when SP separated.   |

#### Input signals

| Signal name | Description                                   |
|-------------|---|
| CSS         | Standby input, "L" indicates TX.              |
| CKY         | Keying input, "L" indicates TX.               |
| MBC         | Main busy input, "L" indicates busy.          |
| SBC         | Sub busy input, "L" indicates busy.           |
| MCD         | Main CTCSS detect signal, "L" indicates busy. |
| SCD         | Sub CTCSS detect signal, "L" indicates busy.  |

| D19       | 14RA SW                     | 144MHz transmit mode : on.  |

### RF UNIT (X44-3060-XX) (B/2) : 430MHz -00 : M2, T, W -11 : K, M1

| Component  | Use/Function                   | Operation/Condition/Compatibility  |
|------------|--------------------------------|--|
| IC201, 202 | RF amplifier                   | Operate in the 900MHz wide band receive mode.  |
| Q201, 202  | RF amplifier                   | Operate in the 430MHz and 440MHz receive mode.   |
| Q203       | 1st mixer                      | Operate in the 430MHz and 440MHz receive mode.<br>430~440MHz (M2,T,W)<br>430~440MHz (M2,T,W)<br>430~450MHz (K M1)<br>5925MHz |
| Q204       | 1st IF amplifier               | Operate in the 430MHz and 440MHz receive mode.   |
| Q205       | 1st IF amplifier SW            | Operate in the 430MHz and 440MHz receive mode.   |
| Q206       | MAIN receive SW                | 430MHz and 440MHz sub receive mode : on.   |
| Q207       | SUB receive SW                 | 430MHz and 440MHz main receive mode : on.  |
| Q208       | RF amplifier                   | 43HET2 (65.23MHz).   |
| Q209       | 2 frequency multiplication     | Operate in the 900MHz wide band receive mode (430HET x 2).   |
| Q210       | 2 frequency multiplication     | Operate in the 900MHz wide band receive mode (43HET2 x 2 130.46MHz).   |
| Q211       | Wide band 1st mixer            | Operate in the 360MHz and 900MHz wide band receive mode.   |
| Q212       | Wide band 1st IF amplifier     | Operate in the 360MHz wide band receive mode (8.505MHz)  |
| Q213       | Wide band 1st IF amplifier     | Operate in the 900MHz wide band receive mode (141 155MHz).   |
| Q214       | Wide band 2nd mixer            | Operate in the 360MHz and 900MHz wide band receive mode.   |
| Q215       | Wide band 2nd mixer SW         | 360MHz and 900MHz wide band receive mode : on.   |
| Q216       | Wide band reference oscillator | Operate in the 360MHz wide band receive mode (19.2MHz).  |
| Q217       | Wide band ref. osc. buffer     | Operate in the 360MHz wide band receive mode (19.2MHz).  |
| Q218, 219  | Transmit 1st mixer             | Operate in the 430MHz and 440MHz transmit mode.<br>10 695MHz - 65 23MHz<br>75 925MHz   |
| Q220       | RF amplifier                   | Operate in the 430MHz and 440MHz transmit mode (75.925MHz).  |
| Q221, 222  | RF amplifier                   | Operate in the 430MHz and 440MHz transmit mode.  |
| Q223       | Transmit pre-driver            | Operate in the 430MHz and 440MHz transmit mode.  |
| Q224       | Transmit driver                | Please carefull to ground lead of RF prove when measurement of Q223 and Q224.  |
| Q225       | Wide band RXB SW               | 360MHz and 900MHz wide band receive mode : on.   |
| Q226       | Wide band SW                   | 360MHz and 900MHz wide band receive mode : on  |
| Q227       | Wide band RXB SW               | 360MHz and 900MHz wide band receive mode : on  |
| 0228       | Wide band SW                   | 360MHz and 900MHz wide band receive mode : on  |
| 0229       | Wide band RXB SW               | 360MHz wide band receive mode : on.  |
| 2230       | RXB SW                         | 430MHz and 440MHz receive mode : on  |

| Component  | Use/Function                    | Operation/Condition/Compatibility  |
|------------|---------------------------------|--|
| D201       | 430, 440MHz and wide band RX SW | Switched between 430MHz and 440MHz and 360MHz receive mode   |
| D202       | MAIN and SUB receive SW         | Switched between 430MHz and 440MHz main and sub receive mode.  |
| D203       | 43HET SW                        | Switched between 430MHz and 440MHz receive and transmit mode.  |
| D204       | 43HET2 SW                       | Switched between 430MHz and 440MHz receive and transmit mode   |
| D205       | 43HET SW                        | Switched between 360MHz and 900MHz wide band receive mode  |
| D206       | 43HET2 SW                       | 900MHz wide band receive mode : on   |
| D207       | IC201 reference voltage         | 5.1V zener diode   |
| D208       | 19.2MHz and 43HET2 x 2 SW       | Switched between 360MHz and 900MHz wide band receive mode.   |
| D209       | 43HET and 43HET2 x 2 SW         | Switched between 360MHz and 900MHz wide band receive mode  |
| D210       | Wide band input SW              | Switched between 360MHz and 900MHz wide band receive mode  |
| D211       | IC202 reference voltage         | 5 1V zener diode   |
| D212, 213  | Wide band 1st IF SW             | Switched between 360MHz and 900MHz wide band receive mode.   |
| D214       | Transmit 2nd mixer              | Operate in the transmit mode<br>354 075~364 075MHz (M2,T,W)<br>354 075~374 075MHz (M2,T,W)<br>354 075~374 075MHz (K M1)<br>75 925MHz |

| Ω5        | RF SW                              | Connect DC voltage 5 ~ 12V through RFC to the 12IF terminal : on<br>Connector : "L", normally : 8V.             |
| Q6        | RF SW                              | Switched IF frequency 287.175MHz to 12IF terminal.<br>Normally : ''L'', Q5 on : ''H''.                          |
| Q7        | SW                                 | Receive mode : Q8 off.  |
| Q8        | Transmit IF amplifier              | Transmit IF 287MHz amplifier.   |
| Q9        | Transmit pre-driver                | Transmit frequency 1240 ~ 1300MHz amplifier.  |
| Q10       | Receive 2 frequency multiplication | 476.4125 ~ 506.4125MHz x 2 = 952.825 to ~ 1012.825MHz.  |
| Q11       | Receive buffer amplifier           | 952.825 ~ 1012.825MHz buffer amplifier.   |
| Q12       | 3 frequency multiplication         | 12HET2 (81.92MHz) × 3 = 245.76MHz.  |
| Q13       | Amplifier                          | 245.76MHz buffer amplifier.   |
| Q14       | IC1 SW                             | 12V voltage supply to IC1 when transmit mode.   |
| D1        | Q1 base AVR                        | Voltage limiter circuit of the Q1 (base).   |
| D2        | Receive mixer SW                   | Receive mode become 12RXB : on, signal supplied to RX mixer Q2.   |
| D3        | Receive IF SW                      | Receive mode become 12RXB : on, apply to IF frequency 287MHz.   |
| D4        |                                    | Receive mode become 12RXB and transmit mode become 12TXB : on, apply to IF frequency 287MHz.                    |
| D5        | Receive IF SW                      | Apply to IF 41.415MHz when receive mode.  |
| D6        | Transmit IF SW                     | Apply to IF 41.415MHz when transmit mode.   |
| D7        | 12IF input/output SW               | 287.175MHz input/output to J1 jack  |

| Component | Use/Function              | Operation/Condition/Compatibility   |
|-----------|---------------------------|---|
| D8        | Transmit IF SW            | Transmit mode become 12TXB : on, apply IF frequency 287MHz.   |
| D9, 10    | Transmit mixer            | Change the 1240 ~ 1300MHz from 287.175MHz in the transmit mode.   |
| D11       | Transmit mixer SW         | Transmit mode become 12TXB : on, 952 ~ 1012MHz signal supplied to D9 and D10.   |
| D12       | Q9 base AVR               | Voltage limiter circuit of the Q9 (base).   |
| D13       | Q11 base AVR              | Voltage limiter circuit of the Q11 (base).  |
| D14, 15   | IF common mixer           | Change the 41.415MHz from 287.175MHz in the receive mode.<br>Change the 287 175MHz from 41.415MHz in the transmit mode. |
| D16       | Protect the time of delay | Protect the time delay to receive mode from transmit mode   |

### FINAL UNIT (X45-3150-00) : Z3 (1.2GHz) OPTION

| Component | Use/Function                  | Operation/Condition/Compatibility  |
|-----------|-------------------------------|--|
| IC1       | Fan Starter comparator        | DC voltage supplied from No. 8 terminal that the thermister TH1 change a resistor value when getting high temperature. |
| IC101     | Drive power module            |  |
| IC102     | Final power module            |  |
| Q1        | Protection SW                 | Delected DC voltage of D2 with reflect wave : on.  |
| Q2        | AVR for Q3                    | Set the drain voltage of Q3 to 3.0V.   |
| Q3        | Receive RF amplifier          | GaAs FET.  |
| Q5        | Fan starter SW                | Detected by thermister, turned on when getting same temperature. Active "L".   |
| D1        | Forwarded wave detection      | Detected forward wave and make a APC voltage.  |
| D2        | Reflected wave detection      | Detected reflect wave and make a protection voltage.   |
| D3        | Spark prevention              | Canceled inverse-electric move force when relay is turned off.   |
| D4        | Limitter                      | Protection in excessive input.   |
| D5        |                               |  |
| D6        |                               |  |
| D7        | IC1 AVR                       | Voltage supply of IC1 become to constant voltage (7.5V zener diode).   |
| D8, 9     | Fan start reversal prevention | - strage sappi, et let seechte to constant vortage (7.57 zeher diode).   |

#### FINAL UNIT (X45-3160-00) : 144MHz

| Component | Use/Function                     | Operation/Condition/Compatibility   |
|-----------|----------------------------------|---|
| IC1       | Temperature detection            | IC1 (1/2) : Power down, IC1 (2/2) : Fan motor operation.  |
| Q1        | Transmit driver                  | 14D terminal : 0.3W, Q1 collector : 1.0W (APC : OFF, RF PWR VR : MIN).  |
| Q2        | TXB SW                           | Adjustable with VR4. Collector voltage is 9.0V in the transmit mode.  |
| Q3        | TXB AVR                          | Approx. 9 3V If TXB voltage is less than 9 3V, either of the Q3 transistor may be faulty. Please tightend screws.   |
| Q4        | Drive + B AVR                    | Approx. 11.5V. If this voltage is less than 11.0V, either of the Q4 transistor may be faulty. Please tightend screws.   |
| Q5, 6     | TXB AVR                          |   |
| Q7, 8     | Drive + B AVR                    |   |
| Q9        | SWR protection control           | Adjustable with VR2. Normally, base voltage is 0 2V and collector voltage is 3 0V in the transmit mode. When the antenna is opened, base voltage is 0.6V and collector voltage is 1.7V. |
| Q10       | SW transistor                    | Operate in transmitter output power is down.  |
| Q11       | SW transistor                    | Operate in cooling fan is working.  |
| Q101      | Final PA                         |   |
| D1        | AVR temp. compensation for drive |   |
| D2, 3     | Transmit/receive select          | Transmit mode : on. If DC source current flows, and no transmitter output is present, either of the diodes may be faulty.   |
| 04        | Forwarded wave detection         | Adjustable with VR1 in the FM transmit mode. 47W flows when transmitter output is measurement.  |

| Component | Use/Function                         | Operation/Condition/Compatibility  |
|-----------|--------------------------------------|--|
| D5        | Reflected wave detection             | Adjustable with VR2. 5 5A flows when the antenna is opened.  |
| D6, 7     | TXB AVR temperature compensation     |  |
| D8        | TXB AVR reference                    | 5.6V zener diode.  |
| D9        | Temp. detection circuit ref. voltage | 7.5V zener diode.  |
| D10, 11   | Surge voltage absorber               | Fan motor.   |
| D12       | Q1 idling                            | Anode voltage is 0.6V in the transmit mode.  |
| D13       | Wired OR                             | Operate in transmitter output is dowwn.  |
| D14       | Wired OR                             | Fan motor.   |
| TH1       | Temperature detection                | Operate in cooling fan is working : approx. 55°C, fan stopped : approx. 45°C<br>Operate in transmitter output is down : approx. 90°C, transmitter output is<br>present : approx. 80°C. |

#### FINAL UNIT (X45-3170-00) : 430MHz

| Component | Use/Function                                | Operation/Condition/Compatibility  |
|-----------|---|--|
| IC1       | Temperature detection                       | IC1 (1/2) : Transmitter output is down, IC1 (2/2) : Operate in cooling fan is working  |
| Q1        | SWR protection control                      | Adjustable with VR2 Normally, base voltage is 0.3V and collector voltage is 3.0V in the transmit mode. When the antenna is opened, base voltage is 0.8V and collector voltage is 2.0V. |
| Q102, 103 | Power hybrid IC                             |  |
| D1        | Protection against reverse power connection | A short-circuit occurs when DC power connection is reversed. If power is not turned on when correct DC power connection is made, it may be due to a burned negative DC cable.          |
| D2, 3     | Transmit/receive select                     | Transmit mode : on. If DC source current flows, and no transmitter output is present, either of the diodes may be faulty.  |
| D4        | Forwarded wave detection                    | Adjustable with VR1 in the FM transmit mode. 42W flows when transmitter output is measurement.   |
| D5        | Reflected wave detection                    | Adjustable with VR2. 7A flows when the antenna is opened.  |
| D6        | Wired OR                                    | Operate in transmitter output is down.   |
| D7        | Wired OR                                    | Fan motor.   |
| D8        | Temp. detection circuit ref. voltage        | 7.5V zener diode.  |

#### IF UNIT (X48-3050-XX) -11 : K, M1, M2 -61 : T, W

| Component | Use/Function             | Operation/Condition/Compatibility                      |
|-----------|--------------------------|--|
| IC1       | SUB FM MIX, IF, SQL      | FM RX, SSB SQ 10.695MHz + 455kHz.                      |
| IC2       | 2ch AF VR                | Separately main and sub.                               |
| IC3       | 10V AVR                  | DC power supply for IC2.                               |
| IC4       | 2ch AF MUTE              | Operate in AF mute when POWER SW is turned on and off. |
| IC5, 6    | AF PA                    | IC5 : main, IC6 : sub.                                 |
| IC7       | 8V AVR                   | DC power supply for sub IF.                            |
| IC8       | MAIN FM MIX, IF, SQL     | FM RX, SSB SQ 10.595MHz-455kHz.                        |
| IC9       | ВМ                       | Balanced modulator.                                    |
| IC10      | MIC amplifier, processor | Operate in the SSB mode (processor).                   |
| IC11      | 8V AVR                   | DC power supply for main IF.                           |

## **DESCRIPTION OF COMPONENTS**

| Componer  | nt Use/Function              | Operation/Condition/Compatibility   |
|-----------|------------------------------|---|
| Q64       | DC SW                        | Main SSB, CW receive mode : "H".  |
| Q65       | DC SW                        | Transmit mode : on, mute to main RX IF.   |
| Q66       | DC SW                        | Processor SW is turn on : on. Increase gain of IC10 to 20dB.                              |
| Q67       | AF amplifier                 | Processor control AF amplifier.   |
| Q68       | AF buffer amplifier          | MIC amplifier output for FM mode.   |
| Q69       | MIC amplifier                | SSB 2nd MIC amplifier.  |
| Q70       | RF SW                        | Receive mode : on.  |
| Q71       | DC SW                        | FM transmit mode : "H".   |
| Q72       | DC SW                        | Main SSB, CW receive mode : "H".  |
| Q73       | 10.695MHz OSC                | 10.695MHz output from the crystal oscillator is modulated.                                |
| Q74       | OSC buffer amplifier         |   |
| Q76       | Transmit IF amplifier        | All band common ALC (10.695MHz).  |
| Q77       | Transmit IF amplifier        | 144MHz and 430 ~ 450MHz transmitter output control, keying.                               |
| Q78       | 1.2GHz transmit 1st mixer    | 10.695MHz - 41.415MHz, keying.  |
| Q80       | 1.2GHz transmit IF amplifier | · · · · · · · · · · · · · · · · · · ·   |
| Q81       | DC SW                        | 144MHz and 430 ~ 450MHz transmit mode : ''H''.  |
| Q82       | DC SW                        | 1.2GHz transmit mode : apply to KEY + B voltage.  |
| Q83       | DC SW                        | 144MHz and 430 ~ 450MHz transmit mode : apply to KEY + B voltage.                         |
| Q84       | DC SW                        | Main 1.2GHz : on.   |
| Ω85       | DC SW                        | SSB transmit mode : on. Reduce the transmitter output to approx. 2dB.                     |
| Q86       | DC buffer amplifier          | ALC meter circuit.  |
| Q87       | DC amplifier                 | ALC meter circuit.  |
| Q88       | DC SW                        | SSB transmit mode : TXB voltage is present and DC power supply for the ALC meter circuit. |
| Q89       | DC SW                        | CONT terminal (ACC4) is "H" : on.   |
| Q90       | DC SW                        | CONT terminal (ACC4) is ''H'' : off. Stop to TIF output.                                  |
| Q91       | DC SW                        | SSB, CW transmit mode : "H".  |
| Q92       | DC SW                        | Main CW (main without CW mode) : ALT output is sent to control unit.                      |
| Q93       | DC SW                        | Main CW mode : on.  |
| Q94       | DC SW                        | Main CW mode : off.   |
| Q95       | DC SW                        | Receive mode : on.  |
| 296       | DC SW                        | Make the RXB voltage of IF unit.  |
| 297       | DC SW                        | Make the RXB voltage of STBY circuit.   |
| 298       | DC SW                        | TXB (9V) voltage in the 144 final unit : on (transmit mode).                              |
| 299       | DC SW                        | Make the transmit information of ext. interface.  |
| 2100      | DC SW                        | 144MHz transmit mode : on.  |
| 2101      | DC SW                        | 430MHz and 440MHz transmit mode : on.   |
| 2102      | DC SW                        | 1.2GHz transmit mode : on.  |
| 2103      | DC SW                        | 144MHz transmit mode : on, open collector.  |
| 2104, 105 | DC SW                        | 430MHz and 440MHz transmit mode : on, open collector.                                     |
| 2106, 107 | DC SW                        | 1.2GHz band : on.   |
| 2108      | DC SW                        | SSB and CW receive mode : "H".  |
| 2109      | DC SW                        | FM receive mode : "H".  |
| 2110      | 1.2GHz KEY SW                | 1.2GHz keying circuit.  |
| 2111      | DC SW                        | 1.2GHz TXG : off.   |
| 2112      | RF SW                        | Transmit mode : mute to main IF.  |
| 2113      | DC SW                        | Transmit with time delay : on, mute to main IF.   |
| 114       | DC SW                        | Transmit mode : off.  |
| 2115      | MIC mute                     | MIC input : off when transmit to packet communication.                                    |
| 2116      | DC SW                        | FM mode : processor off.  |
| 117       | SQ TIME CONST SW             | FM mode : processor on:<br>FM mode : on, C580 is short-circuit.                           |

| D10       | C128 charge holding                |   |
| D11       | DC SW                              | Main AF output muted.   |
| D12       | RF SW                              | FM IF and SSB SQ select.  |
| D13       | Noise RECT.                        |   |
| D14, 15   | Discriminat DET                    |   |
| D16       | SQ DC SW                           |   |
| D17       | 5V zener diode                     | DC power supply (5V) for sub CTCSS unit.                          |
| D18       | AF RECT.                           | Sub AF LED.   |
| D19       | AF RECT.                           | Main AF LED.  |
| D20       | DC SW                              | Sub AF output muted.  |
| D21       | NB DET                             |   |
| D22       | NB SW                              | Increase threshold level to Q36 base voltage.                     |
| D23       | DC OR                              | Operates in OR : NB and sub RBK.                                  |
| D24       | FM IF limiter                      |   |
| D25       | DC SW                              | Transmit mode : main AF output muted.                             |
| D31       | RF SW                              | 1.2GHz receive selected : on.                                     |
| D32       | RF SW                              | 1.2GHz receive select : main or sub.                              |
| D33       | RF SW                              | 1.2GHz receive mode : on.   |
| D34       | RF SW                              | 1.2GHz transmit mode : on.  |
| D35       | RF SW                              | 1.2GHz main receive mode : on.                                    |
| D36       | RF SW                              | 1.2GHz sub receive mode : on.                                     |
| D37       | RF SW                              | 144MHz and 430 ~ 450MHz main receive mode : on.                   |
| D38 ~ 40  | Current reversal prevention        |   |
| D41       | C313 discharge                     |   |
| D42       | RF SW                              | Main NB is active : on.   |
| 043       | DC SW                              | Main CWB + SSB.   |
|           | DC SW                              | Main CWB + SSB + CNB = SCNB.                                      |
|           | DC SW                              | Main CWB + SSB = SCB.   |
|           | DC SW                              | Main CWB + CNB.   |
|           | DC SW                              | 14S + 43S + 12S = FET Q5 bias voltage (gate2).                    |
|           | DC SW                              | 14M + 43M + 12M = FET Q56 bias voltage (gate2).                   |
|           | Q56(gate2) bias temp. compensation |   |
|           | DC SW                              | 14M + 34M.  |
|           | RF SW                              | Main receive mode : on.   |
|           | DC SW                              | Main SCB + CNB.   |
|           | SSB filter SW                      | Main SCB + CNB.<br>Main SSB and CW mode : on.                     |
|           | CWN filter SW                      | mail deb and evv medel on.  |

## **DESCRIPTION OF COMPONENTS**

| Component | Use/Function                | Operation/Condition/Compatibility   |
|-----------|-----------------------------|---|
| D57       | RFSW                        | Main FM mode : on.  |
| D58       | RFSW                        | Main SSB and CW receive mode : on.  |
| D59       | RFSW                        | Main SSB and CW transmit mode : on.   |
| D60       | RF SW                       | Main SSB and CW squelch operate : on.   |
| D61       | RFATT                       | Set to S1 with main SSB receive mode.   |
| D62       | RFSW                        | Main CAR transmit/receive select SW.  |
| D63, 64   | SSB DET                     |   |
| D65       | -6V zener diode             | -6V AVR for DC-DC convertor.  |
| D67       | Current reversal prevention |   |
| D68       | AGC DET                     |   |
| D69       | RFSW                        | Main FM receive mode : on.  |
| D70       | RF SW                       | Main SSB and CW receive mode : on (SSB SQ).   |
| D71       | Current reversal prevention | Main transmit mode : SQ output become compulsory off position.  |
| D72       | Noise RECT.                 |   |
| D73       | Processor AF RECT.          |   |
| D74       | 5V zener diode              | DC power supply for main CTCSS unit.  |
| D75       | DC SW                       | MIC amplifier is turned off when main CW and FM transmit mode.  |
| D76       | Current reversal prevention | CW transmit mode : unbalanced to balanced modulator.  |
| D77       | RF SW                       | Carrier signal input to balanced modulator.   |
| D78       | RF SW                       | Blanced modulator switching.  |
| D79       | RF SW                       | SSB and CW transmit mode : on.  |
| D80       | RF SW                       | Operate in FM transmit mode (10 695MHz). 10 695MHz output from the crystal oscillator is frequency modulated with a vari-cap diode. |
| D81       | Vari-cap diode              | FM modulation.  |
| 082       | DC SW                       | 12M + 12S.  |
| 083       | RF SW                       | 1.2GHz transmit mode : on.  |
| D84       | RF SW                       | 144MHz and 430 ~ 450MHz transmit mode : on.   |
| D85       | RF SW                       | 1.2GHz transmit mode ; on.  |
| 086       | RF SW                       | 144MHz and 430 ~ 450MHz transmit mode : on (CW keying switch).  |
| 087, 88   | Current reversal prevention |   |
| 089       | DC level shift              | Transmitter output decrease when DC power supply is lower than normal voltage.  |
| 090       | Temperature compensation    | ALC meter.  |
| 091       | Current reversal prevention | Ext. ALC.   |
| 92, 93    | Discriminat DET             | Main ALT.   |
| )94       | DC SW                       | Main squelch switching.   |
| 95        | 5V zener diode              | 5V AVR.   |
| 96 ~ 98   | Current reversal prevention |   |
| 99        | Spike-killer                |   |
| 100       | Current reversal prevention | Ext. ALC.   |
| 101       | DC level shift              | Ext. ALC.   |
| 102, 103  | Current reversal prevention |   |
| 104       | FM IF limiter               |   |
| 105       | 5V zener diode              | 5V AVR.   |
|           | Current reversal prevention |   |

TS-790A/E

#### COLLECTION MODULE (X59-3480-00) : This PC board located in the IF unit

| Comp  | oonent     | Use/Function                      | Operation/Condition/Compatibility  |
|-------|------------|-----------------------------------|--|
| (A1)  | (A2)       | AFC (ALT)                         |  |
| IC1   | IC101      | DC amplifier                      | Amplifiered to ceramic discriminator output.                                       |
| Q1    | Q101       | IF amp[lifier                     | Amplifiered to 455kHz signal.  |
| B1)   | (B2)       | MODE (A)                          |  |
| IC21  | IC121      | Mode SW                           | FM, SSB and CW AF selectable with MODE (B) unit.                                   |
| Q21   | Q121       | AF amplifier                      | Amplifiered FM detection output and sent a receive tone signal to CTCSS unit.      |
| 022   | Q122       | DC SW                             | Connect the HPF of CTCSS unit to FM AF line when CTCSS is turned on.               |
| (C1)  | (C2)       | MODE (B)                          |  |
| C41   | IC141      | AF amplifier                      | AF output of SSB, CW and FM mode.  |
| 241   | Q141       | DC SW                             | Detected to tone in the CTCSS unit : on.   |
| Q42   | Q142       | DC SW                             | CTCSS on : on.   |
| (D1)  | (D2)       | S METER                           |  |
| Q61   | Q161       | RF amplifier                      | 455kHz FM S-meter.   |
| 262   | Q162       | RF amplifier                      | 455kHz FM S-meter.   |
| Q63   | Q163       | DC amplifier                      | SSB and CW S-meter.  |
| Q64   | Q164       | DC amplifier                      | SSB and CW S-meter.  |
| (E1)  | (E2)       | SQL CONTROL                       |  |
| Q81   | Q181       | SQL DC SW                         | SQL opened : on. Q81 and Q181 (1/2) : SQL control for packet communication.        |
| 282   | Q182       | DC SW and delay                   | SQL opened : on. Given delay time to closing tail in the CW and SSB mode.          |
| 283   | Q183       | DC SW                             | SQL opened : send a "H" level to SQG terminal. Then, BC terminal is short-circuit. |
| 284   | Q184       | BSY LED SW                        | SQL opened : ''H''. Then, LED will lights.   |
| 081   | D181       | Current reversal prevention       |  |
| 082   | D192       | Current reversal prevention       |  |
| (F)   | 1 1 1 1    | ALC                               |  |
| C201  |            | ALC amp. and RF meter buffer amp. | Make a ALC and RF meter voltage.   |
| 2201  |            | DC buffer amplifier               | RF meter.  |
| D201  |            | Curreent reversal prevention      |  |
| 202   |            | D201 temperature compensation     |  |
| (G)   |            | STBY (A)                          |  |
| 2221  |            | KYB SW                            | Supplied to keying voltage woth time constant when CW key is down.                 |
| 2222  |            | DC SW                             | CW mode : off.   |
| 2223  |            | DC SW                             | CW mode : on.  |
| 2224  |            | KEY SW                            | CW mode : on, require to transmitter with KEY.                                     |
| 2225  |            | CKY SW                            | Detected that CW plug insert to KEY jack.  |
| 2226  |            | CKY SW                            | KEY down in the CW mode : on, information to CPUs (Semi break-in transmit).        |
| 2227, | 228        | STBY SW                           | PTT and SS terminals : short-circuit, transmit information to CPU.                 |
| )221, |            | Current reversal prevention       |  |
| H)    |            | STBY (B)                          |  |
| 2241  |            | AF amplifier                      | Amplifiered to ext. modulation when operates in packet communication.              |
| 2242  |            | PTT, SS SW                        | PTT and SS transmit mode : on.   |
| 2243  |            | Packet communication SW           | Packet communication transmit mode : on.   |
| 2224  |            | DC SW                             | PTT and packet communication transmit mode : on, canceled to MIC stop circuit.     |
| J)    | . <u> </u> | SP SEP                            |  |
| C261  |            | Logic IC                          | Detected that EXT. M and EXT. S plug insert to EXT. jack.                          |
| C262  |            | Analog SW                         | Switched AF output between main and sub from signal of IC261.                      |
| 2261  |            | DC SW                             | SEP signal level shift.  |
| )261, | 262        | Current reversal prevention       |  |
| K)    | -02        | SIDE TONE                         |  |
| 2281  |            | AF OSC                            | · · ·  |
| 2281  |            | OSC SW                            |  |
| 0282  |            | Current reversal prevention       |  |
| 0283  |            | Temperature compensation          |  |

## **DESCRIPTION OF COMPONENTS**

| Component | Use/Function                | Operation/Condition/Compatibility |
|-----------|-----------------------------|-----------------------------------|
| (L)       | AGC AMP                     |                                   |
| IC301     | AGC amplifier               | Operate in the SSB or CW mode.    |
| (M)       | BAND SW                     |                                   |
| Q321      | DC SW                       | 1.2GHz main band : on.            |
| Q322      | DC SW                       | On : apply to TXB voltage.        |
| Q323      | DC SW                       | Receive mode : on.                |
| Q324      | DC SW                       | 1.2GHz main receive mode : "H".   |
| Q325      | DC SW                       | Q324 on or 1.2GHz sub band : on,  |
| Q326      | DC SW                       | Q325 on : ''H'' (band RXB).       |
| D321      | Current reversal prevention |                                   |
| (N)       | FM MIC AMP                  |                                   |
| IC341     | Limiter LPF                 | FM modulation.                    |

#### PLL UNIT (X50-3080-00) (A/2) : 144MHz

### **SEMICONDUCTOR DATA**

#### PLL IC : CX-7925B or CX-7925B-1 (144, 430MHz PLL unit IC2,4,7,10,50,51,54,55) 1.2GHz PLL unit IC1,4

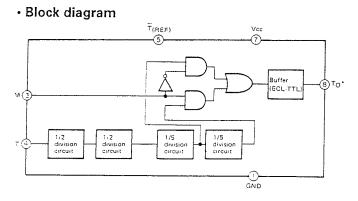

#### Description of terminals

| No. | Symbol | Description   |
|-----|--------|---|
| 1   | VBB    | PC board terminal (connect the 0.01µF capacitor to shortcircuit (GND)).                   |
| 2   | CLK    | Clock input terminal of the 20 bit series input.  |
| 3   | LAT    | Latch signal input terminal of the shift register input and UP/DOWN clock input terminal. |
| 4   | DIN    | Data input terminal and UP/DOWN mode select terminal ("H" : UP, "L" : DOWN).              |
| 5   | XI     |   |
| 6   | ХО     | Reference signal oscillator (X'tal) connection terminals (Max 13MHz, Typ 4MHz).           |
| 7   | PD     | Phase comparator output terminal.   |
| 8   | AO     | External control signal output terminal/UNLOCK output terminal (E/E MOS push-pull).       |
| 9   | BO     | External control signal output terminal/data check terminal (E/E MOS push-pull).          |
| 10  | TVI    | RF signal input terminal (Max. 300MHz or 350MHz), installed 1/2 prescalor.                |
| 11  | FMI    | RF signal input terminal (Max. 150MHz or 180MHz).   |
| 12  | Vdd    | Power supply terminal (+5V).  |
| 13  | AMI    | RF signal input terminal (Max. 40MHz or 50MHz).   |
| 14  | Vss    | GND terminal.   |

### **CONTROLS AND FUNCTIONS**

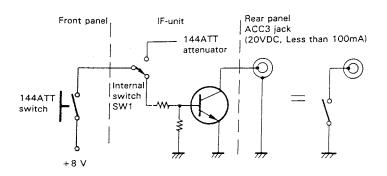

#### 1 ACC 3 jack

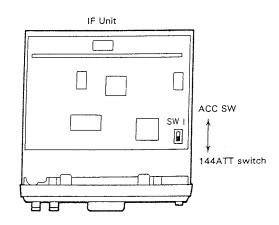

The front-panel 144ATT switch can be used to control an external pre-amplifier for example when switch SW1 (IF unit X48-3050-XX) is placed to the rear as shown in the accompanying figure.

#### Cautions: -

- The 144ATT switch cannot be used to control internal receiver gain when the ACC3 jack is used.
   The outer conductor of the inck is grounded.
- 2. The outer conductor of the jack is grounded.

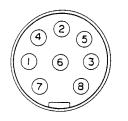

Caution: Do not try to drive a relay directly.

### **CONTROLS AND FUNCTIONS**

#### 12 ACC4 connector

This connector can be used to control an Amateur TV terminal unit.

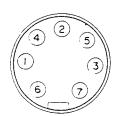

ACC4 View from the rear panel.

#### ACC4 pin assignments

| Pin<br>numbe | Symbol | Use  |
|--------------|--------|--|
| 1            | ALC    | Output of internal ALC voltage.  |
| 2            | GND    | Ground.  |
| 3            | NC     | Unused.  |
| 4            | CNT    | When 5 to 12 V is applied to this terminal, the transmitter IF signal to the RF unit will be blocked.  |
| 5            | NC     | Unused.  |
| 6            | 12TXB  | Voltage of about 8.8 V is output<br>during transmission at 1200 MHz<br>(maximum permissible output cur-<br>rent 50 mA).  |
| 7            | СВ     | The DC supply voltage applied to<br>the power terminal will be avail-<br>able at this terminal via a choke<br>coil and the power switch (maxi-<br>mum permissible output current<br>100 mA). |
| 8            | SS     | External push to talk terminal transmission starts when ground-ed (voltage approximately 5 V).   |

#### **13 EXT CONT connector**

Used to control external devices like a linear amplifier. Use the 7-pin DIN plug provided.

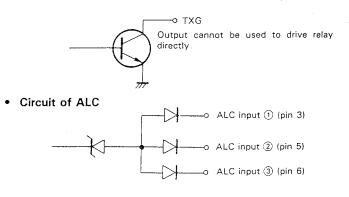

EXT CONT View from the rear panel.

#### EXT CONT pin assignments

| Pin<br>number | Symbol | Use  |
|---------------|--------|--|
| 1             | 43TXG  | Grounded during transmission in<br>430 MHz band. Normally at high<br>impedance. (Maximum permissi-<br>ble voltage 20 V, maximum per-<br>missible current 10 mA).                                     |
| 2             | SS     | External push to talk terminal transmission starts when grounded.  |
| 3             | ALC    | External ALC input ①. ALC threshold is about -6 V.   |
| 4             | 12TXG  | Grounded during transmission in<br>1200 MHz band. Normally at high<br>impedance. (Maximum permissi-<br>ble voltage 20 V, maximum per-<br>missible current 10 mA).<br>(Optional in the TS-790A/790E). |
| 5             | ALC    | External ALC input ②. ALC threshold is about -6 V.   |
| 6             | 14TXG  | Grounded during transmission in<br>144 MHz band. Normally at high<br>impedance. (Maximum permissi-<br>ble voltage 20 V, maximum per-<br>missible current 10 mA).                                     |
| 7             | ALC    | External ALC input ③. ALC threshold is about -6 V.   |

**Reference information** 

Circuit of each TXG (pin numbers 1,4, and 6).

#### (14) KEY jack

Using shielded line, connect a 1/8" phone plug to this jack for CW operation. Open-terminal voltage is approximately 5.5 VDC.

### DATA COMMUNICATIONS

Packet communications will require the use of a terminal unit (available from your dealer).

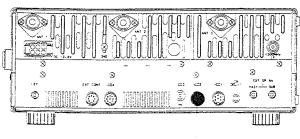

- The Accessory 2 terminal has been provided for connection of Data communications devices. All necessary connections can be accomplished from the same connector.
- 2. When using AFSK (Audio Frequency Shift Keying) or modulating the signal with any form of audio tones you should select LSB or USB. If F2 operation is desired select the FM mode.
- 3. The transceiver will transmit according to the signals received on the STBY pin of the connector. These inputs are generated by the terminal unit in response to inputs from the associated terminal input device.
- 4. When using LSB, or USB the MIC gain control should be used to adjust the input level for an on scale ALC meter reading.
- 5. Various forms of data communication like AFSK, RTTY and PACKET are possible.

Cautions: -

- 1. Do not transmit key down for a extended periods since damage to the unit might occur.
- 2. After continued transmission, allow the system to cool before retransmitting.

| Pin number | Symbol | Use  |
|------------|--------|--|
| 1          | SAF    | SUB receiver audio at a fixed<br>level independent of AF con-<br>trol setting. Output voltage:<br>300 mV/47kΩ or more at high<br>input level             |
| 2          | ACC    | Connected in parallel with ACC 3 pin jack.   |
| 3          | MAF    | MAIN receiver audio at a fixed level independent of AF control setting. Output voltage: $300 \text{ mV}/47 \text{ k}\Omega$ or more at high input level. |
| 4          | GND    | Ground of MAF. (Connect<br>GND of MAIN audio output's<br>shield cable).  |

#### ACC2 pin assignments

ACC2 connector

| 5  | MSQ | GND when MAIN squelch is<br>open (MAIN BUSY indicator is<br>lit). Open when MAIN squelch<br>is closed (MAIN BUSY indica-<br>tor is out). When connection<br>is made to this terminal, you<br>cannot send packets while<br>squelch is open. In SSB-CW<br>mode, reception signal will<br>disappear and the squelch will<br>take time to close. |
|----|-----|--|
| 6  | MSM | MAIN S-meter output (parallel with device's S-meter). Reading of the internal S-meter will be incorrect if you terminate with an impedance of less than $10 \text{ k}\Omega$ .   |
| 7  | SSQ | GND when SUB band squelch<br>is open (SUB BUSY indicator<br>is lit). Open when SUB<br>squelch is closed (SUB BUS)<br>indicator is out). Normally un-<br>used since MAIN channel is<br>used for packet communi-<br>cation.  |
| 8  | GND | Ground of SAF. (Connect<br>GND of SUB audio output's<br>shield cable).   |
| 9  | PKS | Standby terminal exclusively<br>for terminal units. When this<br>terminal is used, the front<br>panel microphone audio input<br>will be muted automatically.   |
| 10 | SSM | SUB S-meter output (analog voltage). Reading of the internal S-meter will be incorrect if you terminate with an impedance of less than 50 k $\Omega$ . Do not apply external voltage to this terminal.   |
| 11 | PKD | Transmit audio input terminal<br>(10 mV, 1 kHz) from terminal  |
| 12 | GND | Ground of PKD. (Connect<br>GND of data signal shield<br>cable)   |
| 13 | SS  | PTT terminal. Transmission<br>begins when grounded. Use<br>Pin 4 or 8 as chassis GND.  |
|    |     |  |

View from the rear panel.

# TS-790A/E Operation with a personal computer

Control with a personal computer is possible with the optional IF-232C interface. For more information, refer to the manuals provided with the interface.

#### Function list

- AUTO INFORMATION ON/OFF setting
- BUSY signal readout
- CTCSS number selection and readout
- CTCSS ON/OFF selection and readout
- DESTINATION CODE selection and readout
- Same function as microphone UP/DOWN switch
- VFO A and VFO B frequency selection and readout
- VFO A and VFO B MEMORY CALL setting
- Model No. readout for transceiver recognization
- Display of transceiver current condition
- LOCK ON/OFF setting and display
- AUTO LOCK TUNE ON/OFF selection and readout
- Memory channel setting
- Mode setting
- Memory display

- MUTE ON/OFF selection and readout
- Memory entry
- OFFSET setting
- RIT frequency clearance
- RIT frequency UP/DOWN
- RIT ON/OFF setting
- RX: For receive operation, TX:For transmit operation
- Scan ON/OFF setting
- S-Meter signal output
- SPLIT ON/OFF setting
- STEP ON/OFF setting
- Sub-tone frequency setting
- TONE ON/OFF setting
- · Generation of synthesized voice

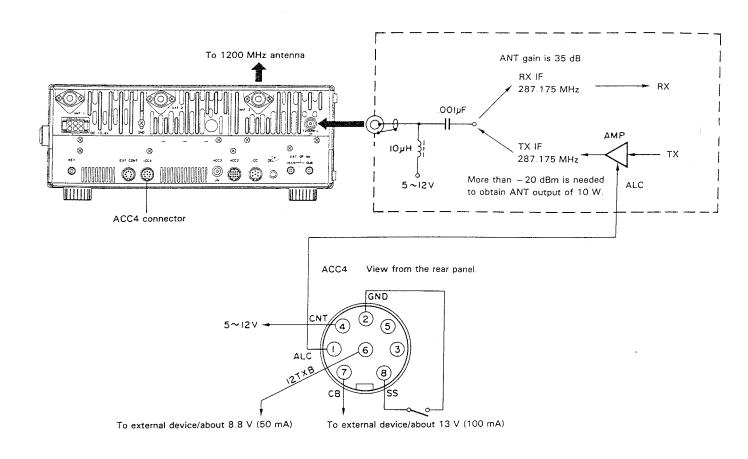

## TS-790A/E 1200MHZ IF CONNECTOR AND ACC4 CONNECTOR

A 5 to 12VDC bias may be applied to the 1200 MHz IF connector, to allow a 1200 MHz IF signal to be used for transmission or reception.

- 1. Set the MAIN channel to the 1200 MHz band.
- 2. Apply 5 to 12 V to CNT terminal of the ACC4 connector.

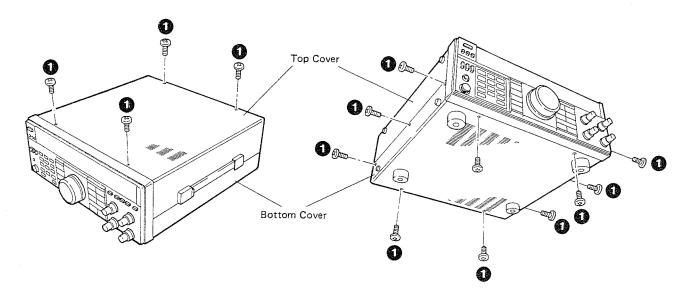

Cautions: -

- 1. When voltage is applied to CNT, you cannot use the front panel microphone jack and internal speaker for transmission and reception.
- 2. Advanced skills and knowledge will be needed for this type of operation. Be very careful to make connections exactly as shown.

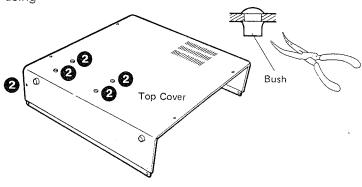

## **UT-10 (OPTION) INSTALLATION**

 Remove the 14 screws holding the top cover and bottom cover ( 1).

2. Remove the 5 bushings from the top cover using diagonal cutters ( 2).

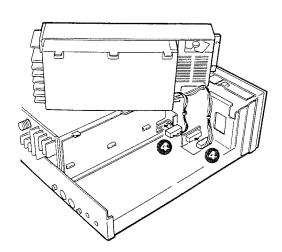

Remove the blind plate from the rear of the chassis ( ③ ).
 Keep the 2 screws removed for later use. They are not needed now

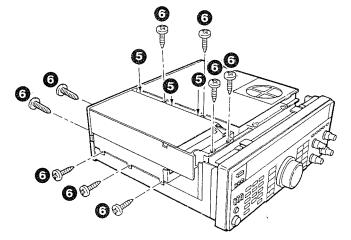

# TS-790A/E UT-10 (OPTION) INSTALLATION

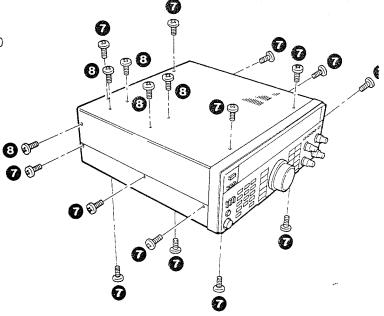

4. Attach the 18-pin connector and the 11-pin connector from the UT-10 (

 Place the UT-10 as shown in figure. Fasten it to the chassis with 3 screws ( ) and 9 self tapping screws (M3 x 8) ( ).

6. Replace the top and bottom covers ( ).
Use 5 pan head screws provided with the UT-10 ( ).

### PARTS LIST

# TS-790A/E

#### PRECAUTIONS ABOUT PARTS LIST

#### On general purpose chip parts

From a part number, the resistance value and capacity value are omitted, and "XXX" is used instead. (Ex.: RD41DB2BXXXJ) In this case, from the circuit diagram, the reference number and resistance value and capacitance value are read, and they are changed into a part number making use of the following table:

In addition, it should be noted that of those parts represented by serial reference numbers, some numbers may be unused. The unused numbers are listed on the circuit diagram.

#### On resistance RD14BB

Of resistance RD14BB, any part number of less than 1/4W is omitted from the parts list.

#### On symbols occurring on parts list

\* : indicates new partsE : EuropeK : USA

- U : PX (Far East Hawaii) UE : AAFES (Europe)
- P : CanadaW : EuropeT : EnglandM : Other Areas
- X : Australia L : Northern Europe

A: indicates safty critical components

**Resistor** value Capacitor value  $22\Omega = 2\ 2\ 0$ 22pF = 220Multiplier - Multiplier - 2nd number 2nd number - 1st number - 1st number  $0.5\Omega = 0R5$ 0.5pF = 0R5 $1\Omega = 010$ 1pF = 010 $10\Omega = 100$ 10pF = 100 $100\Omega = 101$ 100pF = 101 $1000\Omega = 1K\Omega = 102$  $1000pF = 0.001\mu F = 102$  $10K\Omega = 103$  $0.01 \mu F = 103$ 100KΩ = 104  $1000K\Omega = 1M\Omega = 105$ 

Letter "R" is used for the decimal point. In this case, all become significant figures

# TS-790A/E DISASSEMBLY (UT-10: OPTION)

#### PACKING

## ADJUSTMENT

#### **REQUIRED TEST EQUIPMENT**

#### 1. DC V.M and Tester 1) High input impedance 2. RF VTVM (RF V.M) 1) Input impedance : $1M\Omega$ min., 2pF max. 2) Voltage range . F.S = 10mV to 300V 3) Frequency range : Up to 450MHz 3. Frequency Counter (f. counter) 1) Input sensitivity : Approx. 50mV 2) Frequency range : Up to 1300MHz 4. DC Power Supply 1) Voltage : 10V to 17V, variable 2) Current : 15A min. 5. Power Meter 1) Measurement range : Approx. 50W, 3W, 1W 2) Frequency range : 1300MHz 6. AF VTVM (AF V.M) 1) Input impedance : $1M\Omega$ min. 2) Voltage range FS = 1mV to 30V3) Frequency range : 50Hz to 10kHz 7. AF Generator (AG) 1) Output frequency : 100Hz to 10kHz 2) Output voltage 0.5mV to 1V 8. Linear Detector 1) Frequency range : 450MHz 9. Spectrum Analyzer 1) Frequency range : 450MHz **10. Directional Coupler**

#### 11. Oscilloscope

1) High sensitivity oscilloscope with horizontal input terminal

#### 12. SSG

- 1) Frequency range : 1300MHz band
- 2) Modulation: AM and FM MOD
- 3) Output level : -20dBµ to 100dBµ

#### 13. Dummy Load

1) 8 $\Omega$ , 5W (approx )

#### 14. Noise Generator

 Must generate ignition-like noise containing harmonics beyond 450MHz.

#### 15. Sweep Generator

1) Sweep range 144MHz and 450MHz bands

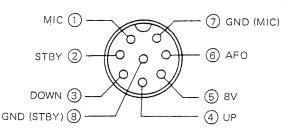

#### 16. Tracking Generator

#### PREPARATION

1) Unless otherwise specified, knobs and switches should be set as follows **Table 10**.

| POWER SW    | ON        | RIT SW      | OFF    |
|-------------|-----------|-------------|--------|
| F. LOCK     | OFF       | AGC FAST    | OFF    |
| 144 ATT     | OFF       | NB          | OFF    |
| 1200 ALT    | OFF       | MAIN AF VR  | MIN    |
| PROC        | OFF       | SUB AF VR   | MIN    |
| MODE        | Any freq. | MAIN SQL VR | MIN    |
| FUNCTION    | MAIN      | SUB SQL VR  | MIN    |
| A/B .       | A         | RIT VR      | Center |
| VFO/M       | VFO       | IF SHIFT VR | Center |
| MUTE (MAIN) | OFF       | MIC VR      | MIN    |
| MUTE (SUB)  | OFF       | RF POWER    | MAX    |
|             |           |             |        |

Table 10

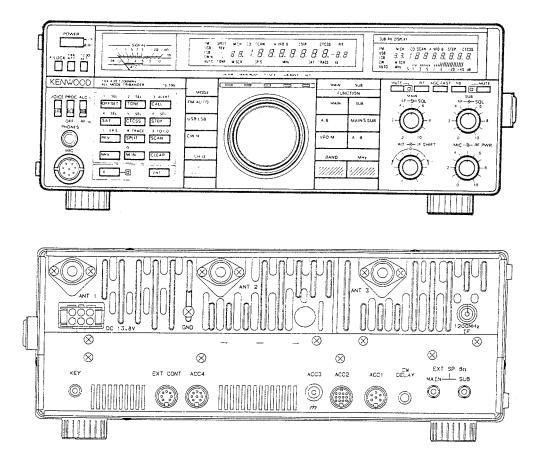

#### Fig. 27 MIC terminals (view from front panel side)

- 2) Use an insulated adjusting rod to adjust trimmers and coils.
- 3) To prevent damaging SSG, never set the stand by switch to SEND while adjusting the receiver section.
- 4) Be sure to turn the power switch OFF, before connecting the power cable to a power source.
- SSG output levels are those at the time the output terminal is open.

Caution1. Please connect the dummy load to ANT connector, when adjust a transmit output. Caution2. In case of repair in the 1.2GHz final unit (option) after repaired a radio conform the receiver sensitivity

# TS-790A/E TS-790A/E BLOCK DIAGRAM

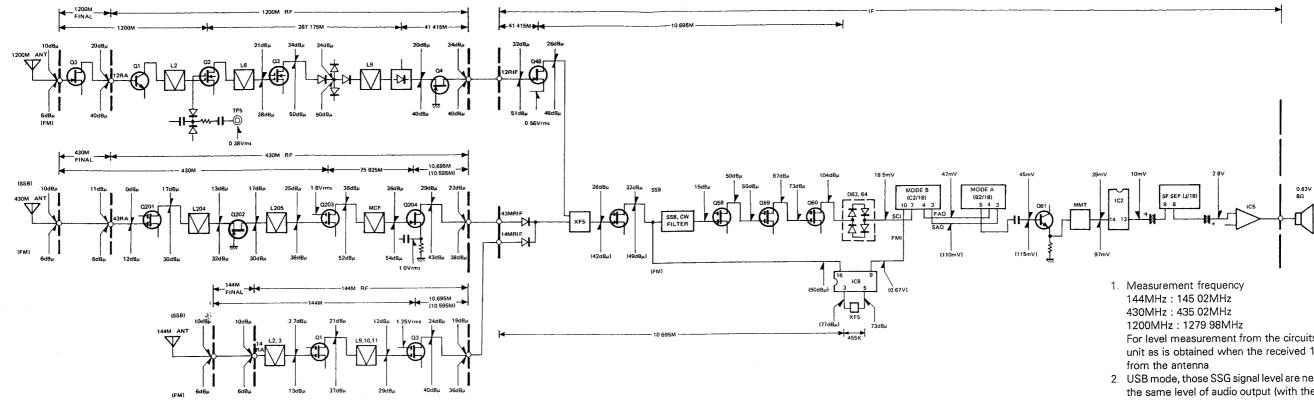

# TS-790A/E TS-790A/E BLOCK DIAGRAM

### TS-790A/E TS-790A/E **LEVEL DIAGRAM**

**RX SECTION** 

**TX SECTION** USB Input:ALC: f=1kHz USØ (FM) . 3W /500 18mV (20mV) 145mV (140mV) M57713 L19, 20

- For level measurement from the circuits following the XF5 of IF unit as is obtained when the received 144MHz signal is applied
- 2. USB mode, those SSG signal level are necessary in order to obtain the same level of audio output (with the AF volume fixed) when 0.63V/8 $\Omega$  audio signals are obtained (using the AF GAIN VR) from 145 02MHz, 435.02MHz and 1279.98MHz, –6dB $\mu$  or –10dB $\mu$ signal input from antenna.
- 3. For FM mode, this SSG signal level is necessary in order to obtain the dame level audio output as is obtained when the S meter reading of 0dBµ or 6dBµ signal is applied from the antenna.
- 4. The level of output from the circuits following the ring detector and FM demodulator is the same as the AF output level (MOD : 1kHz)
- 5. SSG output was measured using a 0 01µF capacitor.

12%

12W

For level measurement from the circuits following the Q78 and Q79 as is obtained when the transmit mode.

2. In IF and RF sections, measurements are taken by an RF VTVM in the FM mode.

In AF section, it is taken by an AF VTVM in the USB mode For level measurement before pin DO in the RF unit, the coaxial cable connected to pin DO is disconnected and then the  $50\Omega$ dummy connected in the RF unit.

3. The audio input voltage in the USB mode, is a 1kHz signal tone which gives a nearly full scale reading within the ALC range.

In the FM mode, it is that which gives the standard modulation degree (±3kHz deviation).

### SP-31 (EXTERNAL SPEAKER)

#### SP-31 SPECIFICATIONS

| Speaker used:             | 10 cm dia            |
|---------------------------|----------------------|
| Rated Input:              | 2 Watts              |
| Impedance:                | 8 Ω                  |
| Frequency response:       | 160 Hz to 7 kHz      |
| Filter cut-off frequency: |                      |
| LOW:                      | 400 Hz, -3 dB        |
| HIGH 1:                   | 3.0 kHz, 3 dB        |
| HIGH 2:                   | 1_2 kHz, - 2 dB      |
| HIGH 1 + HIGH 2:          | 900 Hz, - 3 dB       |
| Filter attenuation:       | - 6 dB/oct           |
| Dimensions:               | W. 180 mm (7-1/16")  |
|                           | H. 120 mm (4-23/32") |
|                           | D 310 mm (12-7/32")  |
| Net weight:               | 2.0 kg (4.4 lbs)     |
|                           |                      |
|                           |                      |

#### Notes: -

1. \*1: Frequency range for M2 type is 430~440 MHz.

2. Circuit and ratings are subject to change without notice due to advancements in technology.

#### 2-2. ACCESSORIES

After unpacking

Shipping container:

Save the boxes and packing in the event your unit needs to be transported for remote operation, maintenance, or service.

## SERVICE TECHNICAL REPORT

| ■:AM      |   | STR No. <sup>B510-94-063E 1/2</sup><br>REFERENCE.                  |
|-----------|---|--|
| MODEL :   | TS-790S   | DATE. Aug. 25 '94  |
| SUBJECT : | Countermeasure against amp I at 430MHz  | z band.  |
| Phenomeno | n:There was a claim in the market that<br>internal speaker when transmitting in<br>This is due to "amp I",or a trouble ca<br>into the audio circuit without demodu] | the SSB mode at 430MHz band.<br>aused by the RF signal penetrating |

1) RF feed back penetrated in the AF circuit. Cause:

> 2) Radiation from the power module IC was transmitted to the chassis to flow into the AF circuit.

Counter-:1) Remove the chip resistor R122( $47k\Omega$ ) in the IF unit(X48-3050-XX).

Insert a 4.7k $\Omega$  lead resistor(RD14BB2C472J)to the different GND pattern measure (as shown in the foil side).

2) Remove the electro-capacitor C130:22uF/25V in the IF unit(X48-3050-XX).

- 3) Insert a shield plate (F11-1133-14) to the 10W power module (M57716) in the 430 FINAL unit (X45-3170-XX).
- 4) Insert a shield plate (F10-2167-04) to the HIGH power module (M57728) in the 430 FINAL unit (X45-3170-XX).
- 5) Insert a shield plate (F10-2167-04) to the HIGH power module (M57727) in the 144 FINAL unit (X45-3160-XX).

Note: The shield plate (F10-2167-04) is a new part.

6) As the shield plates are inserted, all of the screws fixing the power modules 3)-5) shall be also changed.

Round head screw and washer assembly:  $B(N66-4012-46) \rightarrow W(N67-4012-46)$

1227 Control unit EXT COUERACTE: Roce Toc . CU D29 x D30. ALAN JUHN TS - 790Modification Method (1) Modification for operations at other frequencies than specified. a) Frequency ranges (when not adjusted) Display PLL lock range (approx.) 144 MHz band 135~ 174 MHz 140~168 MHz 430 MHz band 300~ 950 MHz 240~373. 425~458. 840~905 MHz 1.2 GHz band 1200~1306 MHz 1230~1305 MHz b) Nodification procedure 1) Cut the destination diode on the Control Unit (X53-3120) according to the frequency requirement. 2) Reset the unit (microprocessor) as follows. Hold down A = B, and turn the POWER switch ON. 3) When the 800 MHz band is to be received, additionally connect an exolusive BNC connector (the attaching hole is provided on the rear panel). Connect the BNC connector (GND to TP202), and lead the lines to TP201 and TP202 on the RF Unit (X44-3060/430 MHz) with a coaxial cable. \*Caution: Use a coaxial cable, otherwise the receiving sensitivity will be very poor. 4) Adjustment (These adjustments have already been made. Perform the following only when you need it.) • 370 N ... L228, L229, L234 S meter peak TC204 ..... F adjustment • 800 M ... L230, L231, L232, S meter peak L218, L219, L220 S meter peak (CN211 for RF voltage peak) (2) Modification of cross-band repeater a) Modification procedure 1) Cut D32 on the Control Unit (X53-3120). 2) Connect resistors to the ACC2 plug as shown below. 100K b) Operation procedure 1) Press F key + Min key. The cross-band operation will be activated and "\*" appears on the display. 2) To deactivate, press F + Min again. 3) To vary the modulation depth, vary the resistor value of ACC2 or adjust VR36 on the internal IF Unit.

q

(TS - 790) Vicroprocessor data of the destination)
