# TS-950SDX

## CIRCUIT DESCRIPTION

### Overview

The TS-950SDX is based on the TS-950SD with modified circuits and improved functions.

#### • Sub IF filter added

A selectable 10.695MHz CW filter (500Hz : YK-107C) has been added for the sub CW mode. A filter through circuit has also been added for monitoring during transmission.

#### • Main and sub stereo reception

There is an independent audio output system for the sub to let you select either mono mixed or stereo reception.

#### • Mode and sub reception range expansion

You can select USB, LSB, CW, CW-R, or FSK in the main and sub independently. Also variable SUB reception range by MAIN frequency  $\pm 1$ MHz.

#### • DDSs as local oscillators

DDSs are used as the main and sub first local oscillators and cover 30MHz in 1Hz steps independently.

#### • Improved DSP reception performance

The DSP-100 can provide PSN detection in SSB, CW, and FSK modes.

#### • The DRU-2 can be connected. (Option)

### Frequency Configuration

The TS-950SDX uses quadruple conversion in SSB, CW, AM, and FSK modes and triple conversion in FM mode. As a transmitter, it uses double conversion in FM mode and triple conversion in SSB, CW, AM, and FSK modes.

The 100kHz IF signal is fed to the DSP in receive mode, and the microphone or key input is fed to the DSP unit in transmit mode. It becomes the 455kHz signal corresponding to each mode and is fed to the main unit. In FM mode, however, only 455kHz carriers are output from the DSP.

Fig. 1 Transmit and receive system frequency configuration

## CIRCUIT DESCRIPTION

### 1. Main frequency configuration

When the receiver frequency according to  $f_{IN}$  in SSB mode gives zero beat (namely, at zero to the SSB signal with a carrier point of  $f_{IN}$ ), the relationship between these signals is expressed by the following equation :

$$f_{IN} = f_{ML1} - f_{ML2} - f_{ML3} - f_{ML4} - f_{MC} \dots (1)$$

Since all these frequencies are generated by the PLL circuit as shown in the PLL system frequency configuration in Figure 2, the receiver frequency is determined only by the reference frequency,  $f_{STD}$ , and the PLL division ratio. Therefore, the reference frequency accuracy equals the operation frequency accuracy.

The accuracy of the reference oscillator used in the TS-950SDX is 0.5PPM (-10 to +50°C) since a temperature-compensated crystal oscillator (TCXO), SO-2, is used. When an external reference frequency is used, its accuracy defines the operation frequency accuracy.

The TS-950SDX local oscillator and CAR PLL are independent of each other. However, they can be operated like a cancel loop configuration by changing the CAR and local oscillator PLL data simultaneously with the microprocessor. This function allows shift ( $f_{MC}$  and  $f_{ML1}$ ) according to mode change to be performed and the band width of the VBT and slope tune to be varied ( $f_{ML4}$  and  $f_{ML3}$ ,  $f_{ML3}$  and  $f_{ML1}$ ).

When used as a transmitter in SSB or other modes, likewise, the frequency is determined by the reference frequency,  $f_{STD}$ , and the division ratio. The display frequencies in the different modes are listed in Table 1. In FSK mode, the TS-950SDX, displays the mark transmitter frequency.

Mode	Display frequency
USB, LSB	Carrier point frequency
CW	Transmission carrier frequency
FSK	Mark transmitter frequency
AM, FM	IF filter center frequency

**Table 1 Display frequency in each mode**

In CW mode, the TS-950SDX receiving pitch can be changed to the required frequency while the desired signal remains in the center of the IF filter band-pass (variable CW pitch system). The receiving pitch is interlocked and varies with the transmitter side tone. This makes it possible to immediately zero-beat by receiving the desired signal at the same pitch as the side tone.

FSK transmission is executed so that the IF is shifted for both transmission and reception so that the mark/space signal passes through the center of the IF filter. Frequency  $f_{ML1}$  is shifted so that the display frequency is the mark transmitter frequency.

FM transmission is obtained in this system by modulating  $f_{ML2}$  by applying the audio signal from the microphone to VCO0.

For reception in AM and FM modes,  $f_{MC}$  is shifted (by 135kHz) by VCO9 so that no carrier enters the IF.

Shift by mode change is performed by  $f_{ML3}$ . In FSK mode, unlike AFSK mode, the signal directly modulated as the IF is output from the DSP. Since the reference frequency to the DSP is supplied from the reference frequency,  $f_{STD}$ , for the main unit.

### 2. Sub frequency configuration

When the receiver tone signal according to frequency  $f_{IN}$  from the antenna gives zero beat, the relationship between the receive signals in SSB mode is expressed by the following equation:

$$f_{IN} = f_{SL1} - f_{SL2} + f_{SC} \dots (2)$$

Frequency  $f_{SL2}$  is produced by a crystal oscillator circuit, but since the signal is input to the PLL circuit that generates  $f_{SL1}$  as a cancel loop, the receiver frequency, like the main frequency, is determined only by the reference frequency,  $f_{STD}$ , and the PLL division ratio. When used as a transmitter in SSB or other modes (sub reception is off in AM and FM modes), likewise, the frequency is determined by the reference frequency,  $f_{STD}$ , and the PLL division ratio. The display frequencies in the different modes are the same as those for the main frequency.

Since sub reception works as a transmission monitor, the IF is shifted to the main display frequency in transmit mode, unlike the display frequency. In AM and FM modes, the frequency always equals the main frequency.

### PLL Circuit

The TS-950SDX PLL circuit consists of a PLL loop (MLO1, SLO1) that includes DDS and covers the frequency range 10kHz to 30MHz in 10Hz or 1Hz steps in accordance with the reference frequency of 20kHz, and a PLL loop that generates other local oscillation (MLO2 to MLO4) and CAR (MCAR, SCAR). Figure 2 shows the PLL system frequency configuration.

The division ratio data to each PLL loop is controlled by microprocessor. Each loop is of a single-crystal-frequency control system : the phase is compared with the unique reference frequency,  $f_{STD}$ .

## CIRCUIT DESCRIPTION

### 1. Reference signal generation circuit (CAR unit)

The reference frequency,  $f_{STD}$ , used for frequency control is determined by the temperature-compensated crystal oscillator (L77-1394-15) (TCXO, SO-2 standard). One reference frequency is output as the reference signal for the PLL unit. The other is divided by two by IC14 : M74LS90P to produce a 10MHz signal. This signal is used as the PLL reference signal,  $f_{REF}$ , for the CAR unit, and is output to the AF unit and DSP unit as the PLL reference signal,  $f_{REF}$ .

The reference signal generation circuit has a VCXO based on the external 10kHz signal to use the external reference input. The 10kHz (1Vp-p) input from EXT STD passes through amplifier Q12 : 2SC2712 and goes to pin 14 of IC13 as the PLL reference signal. The output (20.0MHz) from the VCXO comprising D9, X1, and Q13 is divided by 5 by IC14 and by 2 by IC15 to produce a 1MHz signal. This signal is divided by 100 by IC13 : MC14568BCP to produce a 10kHz comparison frequency. The internal and external reference frequencies can be switched by S1 and S2.

The 20MHz signal input to the PLL unit is divided by two by IC9 : SN74LS7490N to produce a 10MHz signal. The signal is also divided by 5 to produce a 4MHz signal.

### 2. DDS clock generation circuit (PLL unit)

Since  $f_s$  (10.48576MHz) is used for the DDS clock signal, the  $2f_s$  signal (20.97152MHz) is generated and input to the DDS IC.

VCO8 (VCO1 module) generates 97.152MHz, and the signal is input to pin 11 of PLL IC IC5 : CXD1225M and locked. The signal goes to pin 4 of IC6 and is divided by 100 to produce a 971.52kHz signal. It is then applied to pin 2 of IC7 and mixed with a 20MHz signal, and is passed through a band-pass filter to produce a 20.97152MHz signal. The signal is amplified by the Q9 amplifier and goes to pin 40 of IC3 and IC4.

### 3. Main LO1 (PLL unit/AF unit)

DDS IC IC3 : F71022, downstream of LO1, generates 950 to 450kHz in 10 or 1Hz steps. The signal goes to IC9, is mixed with a 4MHz signal, and passed through a band-pass filter to produce a 4.95 to 4.45MHz signal. The signal is further mixed with a 40MHz signal to produce a 35.05 to 35.55MHz signal, and is passed through buffer Q5 : 2SC2714 and output to the AF unit.

In PLL1, upstream of LO1, the VCO1 module generates 73.06 to 103.05MHz. It consists of four VCOs and uses Q1 to Q4 : 2SK210 x 4. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC11 : CXD1225M, and is divided by 20 internally to produce a 500kHz comparison frequency. The VCO1 output is amplified by amplifier Q33 : 2SC2714, and is passed through a band-pass fil-

ter. One output is passed through buffer Q37 : 2SC2996 and goes to the RF unit. The other output is applied to pin 5 of mixer IC12 : SN76514N. The signal is mixed with the signal generated by the PLL unit, and the mixed signal is passed through a band-pass filter to produce a 38 to 68MHz signal. It is passed through the buffer amplifier of Q34 and Q35 : 2SC2714 x 2 and applied to pin 11 of IC11.

This signal is divided by N1 internally, and compared with the 500kHz signal by the phase comparator. The output frequency is locked in 500kHz steps. The division ratio, N1, is transmitted from the digital unit as data (76 to 136) corresponding to 10kHz to 30MHz. One of the four VCO1s is selected according to the VCO change data from the digital unit.

The final output frequency of the main LO1 is 73.06 to 103.05MHz in 10Hz (or 1Hz) steps depending on the data for division ratios N1 and DDS1, and is output to the RF unit.

### 4. Main LO2 (AF unit)

In PLL0, Q1 : 2SK508NV of VCO0 generates 64.22MHz. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC13 : CXD1225M, and is divided by 500 (2000 in FM mode) internally to produce a 20kHz (5kHz in FM mode) comparison frequency. The VCO0 output is applied to pin 11 of IC13, and is divided by 3211 (12844 in FM mode) internally. It is compared with the 20kHz (5kHz in FM mode) signal by the phase comparator. The VCO0 frequency is locked. The division ratio is transmitted from the digital unit.

The output from PLL0 is passed through buffer Q39 : 2SC2714 and the low-pass filter, and is output to the IF unit as the main LO2.

### 5. Main LO3 (CAR unit)

In PLL6, the VCO6 module generates about 162.5MHz. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC3 : CX7925B, and is divided by 5000 internally to produce a 2kHz comparison frequency. The VCO6 output is applied to pin 11 of IC3, and is divided by N6 internally, and compared with the 2kHz signal by the phase comparator. The VCO6 frequency is locked. The division ratio, N6, is transmitted from the digital unit. The bandwidth is changed and the carrier point is finely adjusted by changing the data for the division ratio ( $\Delta N6 = \Delta 2N3$ ) of PLL6 and DDS1 by microprocessor at the same time.

The output from PLL6 is divided by 100 internally by IC4 : M54459L and applied to pin 2 of mixer IC5 : SN16913P. The mixer mixes it with the 10MHz signal. The resulting signal is passed through ceramic filter CF1 to generate a signal of 8.375MHz, and is further passed through amplifier Q3 : 2SC2714, and output to the IF unit as the main LO3.

## CIRCUIT DESCRIPTION

**6. Main LO4 (CAR unit)**

In PLL5, the VCO5 module generates about 35.5MHz. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC1 : CX7925B, and is divided by 5000 internally to produce a 2kHz comparison frequency. The VCO5 output is applied to pin 11 of IC1, and is divided by N5 internally and compared with the 2kHz signal by the phase comparator. The VCO6 frequency is locked. The division ratio, N5, is transmitted from the digital unit.

The bandwidth is changed and the carrier point is finely adjusted by changing the data for the division ratio ( $\Delta N5 = \Delta N3$ ) of PLL5 and DDS1 by microprocessor at the same time. The division ratio is shifted in CW mode as well.

The output from PLL5 is divided by 100 by IC2 : M54459L to generate a 355kHz signal. It is passed through buffer Q1 : 2SC2712, and output to the signal unit as the main LO4.

**7. Sub LO1 (PLL unit)**

DDS IC IC4 : F71022, downstream of SLO1, contains a chopper circuit comprising Q12 and Q13 : 2SK508NV. The 9.695 to 9.195MHz signal is output in 10 or 1Hz steps from Q14 : 2SC2712(Y). This signal is passed through a band-pass filter and goes to pin 2 of mixer IC8 : SN16913P.

The signal is mixed with a 4MHz signal by the mixer, and the resulting signal is passed through a band-pass filter to generate a signal of 13.695 to 13.195MHz. This signal is applied to pin 2 of mixer IC13 : SN16913P. The mixer mixes the signal with the 50.75MHz signal of the sub LO2. The resulting signal is passed through a band-pass filter to generate a signal of 37.055 to 37.555MHz. This signal is applied to pin 2 of mixer IC12 : SN16913P.

In PLL7, upstream of LO1, the VCO7 module generates 40.065 to 70.055MHz. It consists of four VCOs, and uses Q1 to Q4 : 2SK210 x 4. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC11 : CXD1225M, and is divided by 20 internally to produce a 500kHz comparison frequency. The VCO7 output is amplified by Q26 : 2SC2714, and is passed through a band-pass filter. One output is passed through buffer Q29 : 2SC2714 and goes to the RF unit. The other output is passed through buffer Q27 : 2SC2714 and applied to pin 5 of mixer IC12.

The signal is mixed with the signal generated by DDS2 and LO2 OSC2, and is passed through a low-pass filter to produce a signal of 3.0 to 33.0MHz. It is passed through buffer Q25 and Q24 : 2SC2712 x 2 and applied to pin 13 of IC11. This signal is divided by N7 internally, and compared with the 500kHz signal by the phase comparator. The output frequency is locked in 500kHz steps.

The division ratio, N7, is transmitted from the digital unit as data (6 to 66) corresponding to 10kHz to 30MHz in 500kHz steps. The A.LPF uses Q18 to Q20 and Q21 to Q23 : 2SC2714(Y) x 6 and switches the loop constants by VCO7 A to D.

The final output frequency of the sub LO1 is 40.065 to 70.055MHz in 10Hz steps, depending on the division ratios, N7 and N8, and is output to the RF unit.

**8. Sub LO2 (PLL unit)**

Local oscillator signal LO2 is generated by the 50.75MHz crystal oscillator, X1 and O30 : 2SC2714. One local oscillator signal is output to the PLL cancel loop of the sub LO1 and is applied to pin 5 of mixer IC13. The other local oscillator signal is passed through buffer Q32 : 2SC2714 and the low-pass filter, and is directed to the IF unit as the sub LO2. The local oscillator signals generated by the crystal oscillator circuit are input to the PLL loop to cancel drift.

**9. Sub CAR (CAR unit)**

In PLL4, the VCO4 module generates about 69.5MHz. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC6 : CX7925B, and is divided by 5000 internally to produce a 2kHz comparison frequency. The VCO4 output is applied to pin 11 of IC6, and is divided by N4 internally and compared with the 2kHz signal by the phase comparator. The VCO4 frequency is locked. The division ratio, N4, is transmitted from the digital unit.

The output from PLL4 is divided by 100 by IC7 : M54459L and applied to pin 2 of mixer IC8 : SN16913P. In IC8, it is mixed with the 10MHz signal. The resulting signal is passed through ceramic filter CF2 to generate a 10.695MHz signal, and is further passed through amplifier Q5 : 2SC2714 and output to the signal unit as the sub CAR.

## CIRCUIT DESCRIPTION

### 10. Main CAR

In PLL9, the VCO9 module generates about 10MHz. The 10MHz frequency,  $f_{REF}$ , is applied to pin 5 of IC9 : CX7925B, and is divided by 5000 internally to produce a 2kHz comparison frequency. The VCO9 output is applied to pin 11 of IC9, and is divided by N9 internally and compared with the 2kHz signal by the phase comparator. The VCO9 frequency is locked. The division ratio, N9, is transmitted from the digital unit. The division ratios are changed in CW, AM, and FM modes so that the VCO9 frequency is shifted.

One output from PLL9 is applied to pin 2 of mixer IC11 : SN16913P. IC11 mixes it with the 10MHz signal. The signal is passed to a low-pass filter and converted to the 80kHz ( $\pm 50$ kHz) AFT signal used by AF VBT in CW mode. It is then passed through buffer Q10 : 2SC2712 and output to the AF unit.

### 11. Marker signal

The 1MHz signal generated by the reference signal generation circuit of the CAR unit is applied to the MKR module, divided by two internally, and the 500kHz harmonic signal is output to the RF unit when the calibration (CAL) switch is on.

Item	Rating
Center frequency ( $f_0$ ) (The center frequency must be the center of the 3dB band)	8.40MHz $\pm$ 30kHz
3dB attenuation bandwidth	Within 180 $\pm$ 40kHz
20dB attenuation bandwidth	400kHz or less
Insertion loss	9.0dB or less Formula = $20 \cdot \log (E1/2 \cdot E2)$
Ripple	1.0dB or less (within 3dB band)
Spurious attenuation	25dB or more (6 to 10MHz)
Voltage capacity	50V DC (1 minute)
Input and output impedance	330 $\Omega$

### 12. DDS

The DDS IC has been developed with standard cells to implement a high-speed circuit and large-capacity ROM at low cost.

#### • IC configuration

- Two 28-bit registers for setting frequency data, one 28-bit frequency shift register for addition to the frequency register, and a data entry and selection section.
- SIN-ROM that converts phase data to sine data.

#### • Frequency/shift data setting

Using serial signals synchronized with the clock pulses, a total of 30 bits (2 bits that specify the destination in which data is set and 28 bits for frequency data) are set in three internal registers.

#### • Frequency register selection

The data set in the two frequency registers is selected by the SLAB input of the DDS IC. This pin handles the ABSL signal for IC1 and IC3, and the CASL signal for IC2 and IC4. This function eliminates the need for the TS-950SDX microprocessor to set frequency data for each transmission and reception.

## CIRCUIT DESCRIPTION

- **Frequency data selection**

The SPSL input of the DDS IC selects whether to use the data in the internal frequency shift register or the parallel input data as frequency modulation data.

- **Frequency modulation**

The MDEN input of the DDS IC enables or disables frequency modulation. When frequency modulation is enabled, frequency data is added, and the result is input to the phase data operation section.

- **Phase data operation**

The target frequency phase data is output by accumulating 28-bit frequency data in the 28-bit phase accumulator.

$$F_{out} = F_s / 2^{28} \cdot D_{sum}$$

$F_s$  : DDS IC input frequency/2  
(10.48576MHz for TS-950SDX)

$D_{sum}$  : Frequency data +  
Frequency modulation data

If  $2^{25}$  is set for  $D_{sum}$  when  $1/8 F_s$  is output, the phase data must be increased by  $\pi/8$ .

A 28-bit absolute value operation has been used so far, but a 28-bit signed operation can also be used, assuming the MSB is the sign. If complement data of 8000000 to FFFFFFFF (hex) is set, the phase moves in the negative direction for positive data.

- **SIN ROM**

Phase data from the phase data operation section is converted to sine data of 0000 to FFFF (hex) in 16-bit offset binary format.

### 13. Chopper

When the output from the DDS IC is converted to an analog signal by the D/A converter using a ladder resistor network, the possible output frequency range is 0 to  $F_s/5$ . To obtain an output of 9.695MHz, 0.79076 MHz is produced and then converted to 9.695MHz by a mixer.

When you look at the DDS output spectrum when  $F_s$  is 10.48576MHz, the basic frequency is 0.79076 MHz and the harmonic component is 9.695MHz. The level of this component is lower than the basic level because of the aperture effect, and the C/N ratio is not enough. The D/A output is extracted as thin rectangular pulses by the chopper to increase the level to the basic wave level and obtain an output with a sufficient C/N ratio. Use of the chopper eliminates the need for a filter in the mixer input.

## CIRCUIT DESCRIPTION

### Receiver Circuit Configuration

Figure 4 is a receiver block diagram.

The signal from the antenna is passed through the transmitter/receiver selector circuit of the filter unit (X51-306X-XX). It is fed to the RX ANT OUT (RCA jack) on the rear panel, and is applied to the RF unit (X44-3140-00) from RX ANT IN (RCA jack) through the rear cable. This signal is passed through the RF attenuator (0 to 18dB selectable) via relays K1 and K2 and the low-pass filter (30MHz). The impedance is raised to 200Ω by L3, and the signal enters the receiver BPF. The BPF divides the received frequency range (up to 30MHz) into 15 bands, which are automatically selected by the RX BPF control data (RB0 to RB3) from the digital unit (X46-313X-XX).

RX frequency (MHz)	RX BPF data			
	RB3	RB2	RB1	RB0
0.00~ 0.49	1	0	0	1
0.49~ 1.62	0	1	0	0
1.62~ 2.99	0	0	1	1
2.99~ 3.99	0	1	1	0
3.99~ 6.99	0	1	1	1
6.99~ 7.49	1	0	0	0
7.49~ 9.99	0	1	0	1
9.99~10.49	1	1	1	0
10.49~13.99	1	0	1	0
13.99~14.99	0	0	0	0
14.99~17.99	1	0	1	1
17.99~20.99	1	1	0	0
20.99~21.49	0	0	0	1
21.49~24.49	1	1	0	1
24.49~30.00	0	0	1	0

**Table 4 RX BPF select data**

The signal from the BPF passes through the RF AGC circuit composed of pin diodes D37 and D38 : MI204. It is then amplified by the RF amplifier comprising Q5 : 2SK125-5 and Q6 : 2SK520. (When AIP is on, the signal is directed to RF buffer Q4 : 2SK125 with gain 1, not to the RF amplifier.) The amplified signal is separated into the main and sub channels by L70. The signals are passed through different circuits.

The main received signal is passed through buffer Q12 : 2SK520 and the low-pass filter, and is mixed with the VCO signal in the first mixer, Q13 to Q16 : 2SK520. The output is converted to the first IF signal of 73.05MHz. The signal applied to the IF unit (X48-3100-00) from the MIF terminal (CN6) is separated into two channels; one is passed through buffer Q23 : 2SC2714, and is mixed with the HET signal in mixer Q24 : 3SK131 to make a 8.83MHz wide-band signal. This signal is output from the rear as IF OUT1, and is used as a signal for the band scope for station monitor SM-230.

The other is passed through buffer Q44 : 2SK520. The unwanted signal components are eliminated from the signal when it passes through MCF XF2 with 15kHz bandwidth. The signal is amplified by first IF amplifier Q14 : 3SK131, then applied to the second mixer, Q15 and Q16 : 2SK520, mixed with the HET signal (64.22MHz), and converted to the second IF signal (8.83MHz). This signal is separated into two channels; one is supplied to the noise blanker in the AF unit (X49-3050-00), and the other is applied to the second IF signal filter circuit via the noise blanking gate comprising diodes D5 to D8 : RLS135.

This filter circuit has wide-band LC filters L28 and L29, 6kHz MCF (XF4), 2.7kHz MCF (XF3), and 500Hz crystal filter. As an option, the filter circuit permits the use of two types of filter (270Hz) instead of 1.8kHz and 500Hz. These filters can be selected by IC8 : TC9174F of the signal unit (X57-4130-00) to convert serial data from the digital unit (X46-313X-XX) to parallel data.

The received signal, having passed through the second IF filter, is applied to the third mixer Q19 and Q20 : 3SK131, to be mixed with the HET signal (8.375MHz). The signal is then converted to the third IF signal (455kHz). It goes to the signal unit via the TR455 terminal (CN17).

This 455kHz signal is then separated into two channels; FM and non-FM. In FM, the signal is amplified by Q1 : 3SK131 and applied to the third IF filter circuit. This filter circuit has a 6kHz ceramic filter (CF1) and 2.7kHz ceramic filter (CF101). As an option, the filter circuit permits the use of two crystal filters (2.4kHz) instead of 250Hz and 2.7kHz. These filters, like the the second IF filter circuits, can be selected by the output of IC8.

## CIRCUIT DESCRIPTION

	Display	Filter type		Filter selection range			
		Standard	Option	SSB	CW, FSK	AM	FM
8.83MHz	-	LC filter		↑		↑	○
	6kHz	MCF : L71-0266-05		○	○	○	
	2.7kHz	MCF : L71-0222-05		↓		↓	
	1.8kHz		Crystal : YK-88SN-1		↓		
	500Hz	Crystal : YK-88C-1					
	270Hz		Crystal : YK-88CN-1

10.695MHz	2.7kHz	MCF : L71-0249-05					
	500Hz	Crystal : YK-107C					

Either 500Hz or 270Hz can be installed for 8.83MHz.

The bandwidth for the YG-455S-1 is 2.4kHz.

In filter selection, ○ indicates the initial setting and → indicates a selectable range.

**Table 5 Filters and mode-specific selection ranges**

The 455kHz signal from the third IF filter is amplified by Q2 : 3SK131, and is mixed with the CAR signal (355kHz) in fourth receive mixer Q3 : 3SK131. The signal is converted to the fourth IF signal of 100kHz, passed through the notch filter circuit, and input to Q4 : 3SK131. The amplified output is output from the IFO2 terminal (CN15), and the signal is processed by the DSP unit (X53-3390-00) to produce an AF signal.

The output of Q2 is passed through Q304 : 2SK210, applied to Q22 : 2SC2712, and made into the squelch signal for signals other than FM by comparator IC2 (a/2) : NJM2903M. The output of Q4 is passed through Q9 : 2SC2712 and is applied to Q10 : 2SC2712 to produce an AGC signal.

In FM mode, the 455kHz signal is passed through IF buffer Q28 : 2SC2712, and applied to the third IF filter circuit. The filter is selected between wide-band CF2 for the 12kHz band and narrow-band CF3 for the 6kHz band. The output is amplified by limiter amplifier IC6 and IC :  $\mu$ PC577H, then demodulated by ceramic discriminator CF4.

The noise components at approximately 40kHz are eliminated from the demodulated output, and the squelch circuit comprising noise amplifier Q19 and Q20 : 2SC2712 and comparator IC2 (b/2) is operated to produce an FM squelch signal.

The FM AF signal is passed through the deemphasis circuit, and amplified by FM AGC amplifier IC3 :  $\mu$ PC1158H2. If the deviation of the ANT input is 3kHz or more, the circuit keeps the audio output constant and prevents large change in volume. The FM AF signal and the AM AF signal detected by D21 and D22 : RLS73 are output from the FAAF terminal (CN7).

The AF signal from the DAF2, SCAF, or FAAF terminal is applied to AF unit (X49-3050-00). The signal from the DAF2 and SCAF terminals is processed by the CW VBT circuit, and is then applied to the AF amplifier IC7 (a/2) : NJM4558M. The signal from the FAAF terminal is directly applied to AF amplifier IC7 (a/2) : NJM4558M.

The sub received signal is passed through buffer Q7 : 2SK520 and the low-pass filter of the RF unit. The signal is mixed with the sub VCO signal in first sub mixer Q8 to Q11 : 2SK520. The output is converted to the first sub IF signal of 40.055MHz. The unwanted signal components are eliminated from the signal when it passes through MCF (XF1) with 15kHz bandwidth. When the motor is on, the RF transmit signal is applied to the first sub mixer.

# TS-950SDX

## CIRCUIT DESCRIPTION

The first sub IF signal applied to the IF unit from the SUB IF terminal (CN7) is amplified by Q1 : 3SK131, and is mixed with the HET signal (50.7MHz) in mixer Q2 and Q3 : 2SK520 and converted to the second IF signal (10.695MHz). This signal is separated into two channels; one is supplied to the noise blanker circuit, and the other is amplified by second IF amplifier Q5 : 3SK131, which also acts as a noise blanking gate, and goes to the second IF circuit. This filter circuit has a 2.2kHz MCF (XF1) and 500Hz crystal filter (XF5). One of these filters is selected according to the data from the digital unit.

The 10.695MHz signal from the second IF filter is further amplified by second IF amplifier Q9 and Q10 : 3SK131, product detected by IC1 : AN612, and output from the SAF terminal (CN15) as an AF signal.

This sub AF signal goes to the AF unit, where it is separated into two channels; one for sub reception and one for the monitor. For sub reception, the signal is applied to IC7 (b/2). For the monitor, the signal is output to the monitor VR.

The main AF and sub AF are amplified separately by IC7, passed through mute circuit Q8 and Q9 : 2SD1757K, and output to the main and sub AF VR. In CW mode, the sub AF can be passed through the AF VBT circuit.

The AF signal, having passed through the main AF VR is mixed with the signal that has passed through the monitor VR in IC8 (a/2) : NJM4558M. The mixed signal is amplified and output to the control unit (X53-3380-00) from the AF terminal (CN11). The AF signal, having passed through the sub AF VR, enters the control unit (X53-3380-00), and is amplified by IC5 (a/2) : NJM4558M. The sub AF signal and main AF signal from the MAF terminal are converted to mono, mixed, or stereo signals by the analog switch, and amplified by AF power amplifier IC4 and IC6 :  $\mu$ PC2002V to drive the speaker.

	PHONES output		SP output	
	Left side	Right side	EXT	INT
Mono	M + S	M + S	M + S	M + S
Mixed	M + S' (S > S')	S + M' (M > M')	M + S' (S > S')	S + M' (M > M')
Stereo	M	S	M	S

Main AF signal: M; Sub AF signal: S

The mixed and stereo signal levels are adjusted according to the total volume for mono.

## CIRCUIT DESCRIPTION

### 2. SLOPE-TUNE and IF VBT

Figure 5 shows the configuration of the receiver related to the TS-950SDX SLOPE-TUNE and IF VBT. The operating principle of SSB-SLOPE-TUNE is explained first. When  $f_{ML1}$ ,  $f_{ML3}$ , and  $f_{ML4}$  in Figure 6 are at their normal frequencies, the synthesized bandwidth is indicated by A. When the frequency of  $f_{ML4}$  is highered and the frequency of  $f_{ML3}$  is lowered by  $\Delta f_1$ , only the third IF filter for the 455kHz band shifts to position B. The synthesized bandwidth is the part overlapped by A and B. When the frequencies of  $f_{ML1}$  and  $f_{ML3}$  are lowered by  $\Delta f_2$ , only the 8.83MHz second IF filter shifts to position C. The synthesized bandwidth is the part overlapped by B and C. The SSB-SLOPE-TUNE allows these operations to be done independently using two controls.

The TS-950SDX generates the frequencies with the PLL circuit, and controls them by microprocessor. Change amount  $\Delta f_1$  and  $\Delta f_2$  is tracked digitally, allowing only the bandwidth to narrow without changing the center frequency of the composite passband.

Next, the operating principle of IF VBT is explained. Designed so the relation between the frequency changes of the PLL data becomes  $\Delta f_2 = \Delta f_1$ , the synthesized passband widths of the third IF filter ( $f_{IF3}$ ) and the second IF filter ( $f_{IF2}$ ) can be varied by only one control.

## CIRCUIT DESCRIPTION

### 3. AF VBT circuit

Filter IC2 : MF10CCWM is inserted into the AF amplifier to eliminate radio interference. This circuit functions only in CW mode when the AF TUNE switch is on.

When the side tone receive pitch is changed by the PITCH control, the center frequency of this filter is also changed. Q can be changed continuously by the AF VBT VR (semi-fixed VR : VR1 on the pc board for the sub).

When SSBC or FSKC goes low in a mode other than FM and AM, Q3 turns on via D3, and IC5 (a/4) and (b/4) turn on. When CWB goes high in CW mode, IC5 (a/4) and (b/4) turn on via R20 and D1. The signal is not passed through filter IC2. If AF TUNE is pressed at this point, AFT SW goes high, Q4 turns on, and IC5 (a/4) and (b/4) turn off. Since CWC is low, Q5 turns on and IC5 (c/4) and (d/4) turn on. The filter circuit output via IC2 is selected by analog switch IC5.

Center frequency  $f_0$  of the filter is 1/50th the clock frequency. The signal obtained by rectifying the AFT with a frequency of 40 to 100kHz (in CW mode) by Q1 and dividing it by IC1 is input as the clock, and  $f_0$  is 400 to 1000Hz, being changed by the PITCH control.

The passband width can be varied by the AF VBT VR connected between pins 17 and 18 in the main receiver. The passband width can be varied by semi-fixed VR1 (10k $\Omega$ ) in the sub receiver. It can be adjusted to within  $\pm 100$ Hz.

Filter IC2 : MF10CCWM used here contains two blocks comprising a general active filter. Various second filters can be formed by using external resistors. The center frequency depends on the clock frequency, and the filter characteristics and clock frequency can be adjusted and set at will according to the ratio of the external resistances.

## CIRCUIT DESCRIPTION

### 4. Signal-strength meter circuit

In modes other than main FM, the signal-strength meter circuit comprises operational amplifier IC300 (b/2) : NJM2904M of the IF unit. The 100kHz IF signal is detected by D23 : HSM88AS in the signal unit, amplified by Q11 : 2SK210, Q12 : 2SC2712, and Q13 : 2SA1162, and output to the IF unit as the AGC voltage. If the reference voltage of the signal-strength meter is applied to the + pin (pin 5) of reverse amplifier IC300 (b/2), and the AGC voltage is applied to the - pin (pin 6), the AGC voltage change is output from the output pin (pin 7) to the signal unit as the AGCA signal.

In FM mode, the 455kHz FM IF signal of the signal unit is amplified by Q34 : 2SC2712, and detected by D67 : HSM88AS. This voltage becomes the SM signal, is switched to the AGCA signal by the analog switch, and finally output to the digital unit from the SMET pin.

The sub signal-strength meter circuit also comprises an operational amplifier. The 10.695MHz IF signal of the IF unit is detected by D3 : HSM88AS, amplified by Q12 : 2SC2712, and output as the AGC voltage. If the reference voltage of the signal-strength meter is applied to the - pin (pin 2) of reverse amplifier IC300 (a/2), and the AGC voltage is applied to the + pin (pin 3), the SM signal is output from the output pin (pin 1) and SSMT pin to the digital unit.

The digital unit converts the analog signal to a digital value, performs operations in each mode, and drives the meter.

### 5. Noise Blanker Circuits

#### • NB1

NB1 is a noise blanker circuit that blanks for short-period pulses, such as ignition noise. The 8.83MHz IF signal generated from the 73.05MHz first main IF signal is amplified by noise amplifier Q40 : 2SK210, Q41, Q42 and Q44 : 2SC2712, passes through buffer Q45 : 2SC2712, and is noise-detected by D30 : HSM88AS. This signal switches Q47 : 2SC2712, turns Q48 : DTA124EK on, and switches the main IF signal line according to the noise. The signal turns Q48 on, turns IF unit Q6 and Q8 : 2SC2712 on, and switches the sub IF signal line according to the main noise.

The 10.695MHz IF signal generated from the 40.055MHz first sub IF signal is amplified by noise amplifier Q26 : 2SK210, Q27 to Q29 : 2SC2714 of the IF unit, passes through buffer Q31 : 2SC2714, and is noise-detected by D33 : HSM88AS. This signal switches Q33 : 2SC2712, turns Q34 : DTA124EK on, switches Q8 and Q6, and switches the sub IF signal line according to the noise. The signal turns Q34 on, and switches the main IF signal line according to the sub noise.

When NB1 turns on, the DC voltage is applied to the Q47 emitter of the AF unit from threshold variable resistor VR12 for the main. The DC voltage is applied to the Q33 emitter of the IF unit from threshold variable resistor VR12 for the sub. The NB effect can be adjusted by changing the emitter voltage.

## CIRCUIT DESCRIPTION

Fig. 9 Noise blander circuit configuration

## CIRCUIT DESCRIPTION

### • NB2

NB2 is a noise blanker circuit that blanks noises having a comparatively long period and a large pulse width, like woodpecker noise.

For the main NB2, the noise signal amplified by noise-amplifiers Q40, Q41, Q42, and Q44 of the AF unit is noise detected by D28 : HSM88AS in the same way as for NB1. The threshold voltage of the Q46 : 2SC2712 emitter is varied by VR12. The Q46 output enters the NB2 module (X59-3350-00) to generate a pulse width and period synchronizing with the woodpecker noise.

For the sub NB2, the noise signal amplified by the noise amplifiers Q26 to Q29 is noise detected by the IF unit D32 : HSM88AS in the same way as for NB1. The threshold voltage of the emitter Q32 : 2SC2712 is varied by VR12. The Q32 output enters the NB2 module unit (X59-3350-00) to generate the pulse width and period synchronizing with the woodpecker noise.

The NB2 switching signal detected by the main IF and the NB2 switching signal detected by the sub IF switch the main and sub IF signal lines in the same way as for NB1.

The IC1 : TC4011BF (1/4), (4/4), and (2/4), (3/4) in the module unit are set to a pulse width of 40ms. Normally, the woodpecker noise has a pulse width of 3 to 4ms and a period of 80 to 100ms. Some woodpecker noises have a period of about 50ms though rare. Therefore, even a woodpecker noise with a large pulse width can be blanked by switching the noise in a 5ms interval. However, if a noise with a period of several ms like an ignition noise is blanked in a 5ms interval, the signal receive time becomes zero. To prevent it, a one-shot multi is composed of IC1 (2/4) and (3/4) so that the next pulse is not blanked for 40ms after one shot is issued from (1/4) and (4/4).

### Transmitter Circuit Configuration

The transmitter system configuration is shown in Figure 10. The transmitter system operates as a quadruple conversion system in SSB, CW, and AM modes, and as a double conversion system in FM mode.

The audio signal from the microphone enters the switch unit (A) (H/10) from the microphone connector board of the switch unit (A) (D/10). The signal is amplified by the MIC AMP module and is passed through buffer amplifier Q17 : 2SC2712 and split into the SSB, AM MIC system and FM, VOX system. The input from the rear panel enters from PHONE IN and ACC2 on the IF unit, is amplified by Q42 : 2SC2712, and matched with the input of Q17 of the switch unit (A) (H/10).

The SSB, AM MIC system of the switch unit (A) (H/10) is split to the MIC GAIN VR and the PROC IN VR on the same board. When S59 of the switch unit (A) (G/10) is on, PROC IN is selected. When S59 is off, the MIC GAIN is selected.

The FM and VOX signals of the switch unit (A) (E/10) are switched to the FM and VOX systems. The FM signal enters the FM MIC AMP circuit of the AF unit, and the VOX signal enters the VOX circuit of the AF unit via the VOX GAIN VR of the switch unit (A) (E/10).

The SSB, AM MIC signals enter the signal unit and are output to the DSP unit as the DSP MIC signal. The 455kHz IF signal modulated by the DSP unit enters the signal unit again, is amplified by Q27 : 3SK131, passed through buffer Q25 : 2SC2712, and output from the signal unit.

The speech processor can be operated in SSB only. In FSK, it is automatically switched to the processor. When the speech processor is on, the SSB signal branched from the Q27 output is amplified by Q33 : 2SC2712, and the components above a certain level are clipped. The signal is amplified by Q30 : 3SK131. The output level of the speech processor is varied by changing the second gate voltage of Q30. The output level is altered by VR1 : PROC OUT of the switch unit (A) (H/10). The Q30 processor output is passed through ceramic filter CF5, and is switched to the output when the Q25 processor is turned off by D60 to D62 : RLS73 x 3. It is output from the signal unit.

# TS-950SDX

## CIRCUIT DESCRIPTION

Fig. 10 Transmitter circuit block diagram

## CIRCUIT DESCRIPTION

The signal output from the signal unit enters the IF unit and is mixed with the 8.375MHz third local signal by Q41 : 3SK131 to make a 8.83MHz signal. This signal is passed through ceramic filter CF1, amplifier Q40 : 2SC2712 for matching the next crystal filter, and the 8.83MHz IF filter. The SSB, FM, FSK are passed through XF3 : YK-88S, and CW and AM are passed through filter unit (C/3). The filter output is amplified by Q38 : 3SK131. ALC is applied to this Q38.

The Q38 output is mixed with the second local signal of 64.22MHz in Q36 and Q37 : 3SK131 x 2 to make a 73.05MHz signal. This signal enters the RF unit.

In the RF unit, the signal is passed through three LC bandpass filters L93 to L95, is mixed with the first local signal in Q20 and Q21 : 3SK131 x 2, and converted to the target transmit frequency. The output of Q20 and Q21 is passed through the band pass filter which are split to three frequency ranges (to 7.5MHz (low-pass filter), 7.5MHz to 14.5MHz, 14.5MHz to 30MHz (band-pass filter)), amplified by Q22 : 3SK131 and Q19 : 2SK2954, and output from DRIVE OUT on the rear panel. The signal enters the final unit from DRIVE IN through the jumper cable at the rear.

The signal is amplified to 100W by Q1 : 2SC1971, Q2 and Q3 : 2SC3133 x 2, Q4 : MRF150MP. Harmonics are eliminated from the signal by the filter unit, and the signal is emitted from the antenna.

For FSK, the mark and space signals are generated by the DSP unit and output to the signal unit. In the FSK mode, the speech processor circuit works, performs 10 to 20dB compression, and suppresses the difference in the level between the mark and space.

The FM signal is passed through buffer Q20 : 2SC2712 and the FM MIC AMP module in the AF unit, and modulated to the second local oscillator.

### 1. ALC Circuit

The level of the forward wave voltage (VSF) detected in the filter unit is adjusted by VR6 and VR7 (VSF) of the control unit and is applied to the differential amplifier comprised of Q1 and Q2 : 2SC2712 x 2.

When VSF is applied to the base of Q1, the emitter voltages of Q1 and Q2 increase and the current flowing through the base of Q2 decreases. Therefore, the collector voltage of Q2 rises. When this voltage exceeds the emitter voltage of Q8 : 2SC2712 (about 1.8V; stabilized by LED D6), the current flows through the base of Q8 and the collector voltage drops. ALC time constant C, R is connected to this collector.

The change in the collector voltage is shifted to about 2.7V by Q11 : 2SK208 and D7 : RLZJ4.7B, matched with the voltage for keying by Q12 : 2SC2712 and D8 : RLS73 to generate the ALC voltage. This ALC voltage activates ALC by lowering the second gate voltage of Q38 : 3SK131 of the IF unit.

### 2. Power control circuit

Power is controlled (reduced) by lowering the base voltage of Q2 of the control unit. As the base voltage of Q2 is decreased, the emitter voltage of Q1 and Q2 are decreased. This allows Q1 to be turned on even if the base voltage (VSF) of Q1 is low. That is, ALC works to lower the power even if the power is low.

When the power is maximum, Q7 : DTC124EK is on, Q3 and Q5 : DTC124EK x 2 are off, and VR2 (PWR VR) of the switch unit (A) (H/10) is shorted. Therefore, the base voltage of Q2 has the value divided by R3, R4 and PWR VR. When PWR VR is turned to MIN, the base voltage of Q2 is lowered, and ALC starts with low power. When PWR VR is set to MIN, VR5 (MIN) and PWR VR of the control unit are made parallel, and the MIN power can be adjusted by VR5.

The 50W power down during movement is accomplished by turning on S1 of the control unit by turning on Q3. The 100W power is decreased by connecting VR8 (50W) of the control unit in parallel. When the power is reduced to 50W, the power is also reduced if PWR VR is MIN.

## CIRCUIT DESCRIPTION

### 2. Auto tuning mode

The transmission power from the final unit via the filter unit is passed through the current/voltage detection transformer L1 and L2 which use a toroidal core. The current and voltage components detected here are rectified by the waveform rectification circuit consisting of D4, Q1, D7, and Q2, and then phase compared by IC1 : SN74S74N. The output signals from pins 8 and 9 of IC1 ( $\bar{Q}$  and Q) are passed through the switch by IC2 : TC4066BP and are applied to motor drive IC IC4. Variable capacitor VC1 is rotated by the motor M1 so that the phase difference of the voltage and current components decrease.

The voltage and current components detected by L1 and L2 are rectified by germanium diodes D1 and D2 : 1N60 and are applied to the comparator of voltage comparison circuit IC6 : NJM2903S as the amplitude component. The comparator output is passed through switch IC3 : TC4066BP. Motor M2 is driven by another motor drive IC IC5 : BA6109U2 and variable capacitor VC2 is rotated in the direction that decreases the amplitude difference of the voltage and current components.

Variable capacitor VC1 for capacity adjustment is therefore controlled so that the current and voltage phases match. Variable capacitor VC2 for resistance adjustment is controlled so that the current and voltage amplitude difference decreases. (SWR : 1 when the phases match and the amplitude difference is 0).

The speeds of motors M1 and M2 are determined by the duty cycle of the pulse input to control input pin 8 of IC4 and IC5, and controlled by the standing wave ratio (VSWR) calculated by the digital unit CPU and preset and manual tuning speed.

Pulse signal SPED output from the digital unit is passed through Q5 : DTC114EK, amplified by Q4 : 2SA1204, and input to IC4 and IC5 as a control pulse.

If the SWR is 3 or more, the motor runs at high speed since the duty cycle of the motor drive voltage pulse is 100%. If the SWR is 2, the duty cycle becomes about 50%, and the motor runs at low speed.

The matching circuit is a T type, and the tap position from 1.8 to 30MHz is switched by seven relays, K101 to K103 and K105 to K108.

Position detection VRs VR101 and VR102 are linked to the rotation axes of variable capacitors VC1 and VC2 with a gear ratio of 1 : 1. Voltages of 0 to 5V (POD1 and POD) are produced according to the capacitances of the variable capacitors. This position data is sent to the CPU through the A/D converter in the digital unit, and is used as the reference voltage in the feedback control system for, such operations as preset tuning and manual tuning. The same signal is also used for presetting data and end detection.

Fig. 14 Auto antenna tuner block diagram

## CIRCUIT DESCRIPTION

Fig. 11 ALC, power control, and protection circuits

### 6. Monitor circuit

#### • Modes other than FM

The TS-950SDX monitor circuit uses a sub receiver to receive and monitor the signals converted to transmission frequencies, unlike the conventional monitor circuit that monitors the IF signals. The monitor circuit produces the same monitor tone as when another receiver monitors the transmitted signal. (In the AM mode, the signal is passed through the SSB filter and product detected.)

The signal taken from the band pass filter output before Q33 of the RF unit goes to the first mixer (Q8 to Q11) of the sub receiver via D49. Since the level is too high, it is attenuated by Q37 only when the signal is monitored at the filling point, and is further attenuated by Q4 of the IF unit. The amount of attenuation in the IF can be adjusted by VR1, and the degree of AGC can be changed.

The sub receiver output SAF is passed through IC6 (c/4) and IC10 (d/4) of the AF unit, applied to IC8 (a/2) via the monitor volume. It is amplified and output in the same way as in receive mode.

#### • FM mode

The signal output (pin 2) having passed through the clipper and preemphasis circuit in the FM microphone amplifier circuit (X59-3000-03) is corrected by the deemphasis circuit. The resulting signal is passed through IC10 (c/4), applied to the IC10 (d/4) input (pin 10), and amplified and output as in the modes other than FM.

# TS-950SDX

## CIRCUIT DESCRIPTION

Fig. 12 Monitor circuit

## CIRCUIT DESCRIPTION

### 7. Side tone generation circuit

The AFT (80kHz when the PITCH control is at the center; the frequency is changed to 40 to 100kHz by turning the control; 150kHz in the SSB mode) generated by the CAR unit is rectified by Q1. The 400 to 1000Hz square wave divided by 100 by IC1 is applied to switched capacitor filter IC3 to obtain a sine wave interlocked with the CW receive pitch. The 20 to 50kHz signal obtained by dividing AFT by 2 by IC1 is

given to the clock that determines the center frequency in IC3.

Keying switches Q7 by the KEY signal that goes high when the key is down and that is output from the control unit. It turns on the bias of mute transistor Q6 to produce the sine waves intermittently.

When the monitor is on, Q6 is biased through R27 to turn off the side tone.

Fig. 13 Side tone circuit

## AT Unit

### 1. Auto antenna tuner

When the AUTO/THRU switch is set to AUTO, the logic is controlled by the digital unit, ATA goes low, the AUTO/THRU switching relay K1 is made, and AT is inserted to prepare for tuning. If the position of variable capacitor VC1 or VC2 is not the preset position of the band, presetting is performed. The AT tune and transmission do not occur until presetting ends.

When AT TUNE is turned on with this condition, ATS goes high, the CW mode is set, and the transmission output becomes about 10W. If the VSWR is lower

than 1.2, the tuning is completed and auto antenna tuning ends.

If the VSWR is greater than 1.2, the motor control pulse duty (described later) is controlled according to the VSWR.

The motor speed is determined by a microcomputer. Its direction is controlled by phase comparator IC1 and amplitude comparator IC6 if the APRE is low, and controlled by the microcomputer if the APRE is high.

## CIRCUIT DESCRIPTION

For AT tuning, the power is lowered to about 10W. The AT start signal (ATS) turns on Q5 and the base of Q2 is grounded via R12 to lower the power.

Q4 : DTC124EK is used to turn off the 50W power down circuit during movement. Q6 : DTC124EK is used to turn off PWR VR to prevent influence of PWR VR on tuning.

If the power control is used only when the ALC starts, it works deeper as the power is lowered. Therefore, the PWR VR of the switch unit (A) (H/10) has two functions: one controls ALC, and the other changes the second gate voltage (PCV) of Q22 : 3SK131 of the RF unit. By changing the gate voltage, the difference between the maximum and minimum gains is approximately 10dB to prevent excessive ALC when the power is low.

The gain is also reduced during AT tuning. When the ATS signal arrives at the RF unit, PCV is grounded to eliminate the influence of PWR VR, and the second gate voltage is made constant (nearly the same value as the PWR VR MIN) by the voltage obtained by dividing the ATS.

### 3. Protection circuit

#### • SWR protection

When the reflected wave voltage (VSR) from the filter unit is raised by load variation or AT tuning, Q9 : 2SC2712 of the control unit is turned on, the voltage of the line of the ALC time constant is decreased. The power is lowered by decreasing the drive to protect the final transistor.

#### • IC protection

The current of the final transistor is detected by the voltage across R38 of the final unit. Since the detected voltage is negative, it is inverted and amplified by IC3 (1/2) : NJM4558M of the control unit. The IC3 output turns on Q10 : 2SC2712, reduces the voltage of the line of the ALC time constant and decreases the drive to limit the final transistor current.

When the fuse of the final unit blows, 50V AVR is turned off, TXI is grounded by D7 : MC921, Q15 : DTA124ES, and Q14 : DTC124ES, and transmission is disabled.

### 4. Temperature protection

If the final heat sink temperature rises to approximately 50°C, temperature switch S1 of the final unit turns on. The current flows to the fan motor through R23 and D5 : 1S1555, R36 and D10 : UPZ4.7B, and the fan motor starts running at low speed. D10 is a zener diode that produces the current for starting the motor.

If the final heat sink temperature rises to approximately 70°C, S2 turns on, and D10 and R36 are shorted. The voltage applied to the motor increases and the fan motor runs at high speed. If the sink temperature reaches 90°C by some failure, S3 turns on, TXI is grounded, and transmission is disabled.

If the power transformer temperature rises to approximately 80°C, temperature detection switch S1 of the AVR unit turns off, the TPT signal (about 5V) turns on Q3 of the control unit, and the power is lowered to 50W to protect the transformer.

### 5. Safety discharge cooling circuit

70 to 80V is applied to the electrolytic capacitor of the 50V power supply. When the power switch is turned off, the charge voltage does not drop soon. Since the 15V power supply voltage falls soon when the power supply turns off, the fan motor consumes the charged voltage of the 50V power supply.

The 15V power supply voltage drop is detected by the final unit D4 : MTZ4.7JC. If the voltage drops to approx. 10V, Q11 : DTC124ES turns off. The collector voltage of Q11 rises, and Q12 : DTC123TS turns on and Q13 turns on. The 50V line runs the fan motor through R27, Q13, R26, and D6, and discharges slowly.

## CIRCUIT DESCRIPTION

The VR used here is a normal one, not an endless one. Since the rotation angle of this VR is limited, the rotation range for the TS-950SDX is from the minimum capacitance to the maximum capacitance plus an allowance.

Using this control system, like preset tuning, which will be described later, POD1 and POD2 are monitored by the microprocessor. If the lower limit voltage of 0.6V or the upper limit voltage of 4.2V is reached, the microprocessor detects that the voltage is close to one limit. To return the voltage to the opposite side, APRE is made high. If the variable capacitor is VC1, and the voltage is close to the lower limit with respect to PRE1, the voltage near the upper limit is output. If the voltage is close to the upper limit with respect to PRE1, the voltage near the lower limit is output.

The other variable capacitor, VC2, outputs the voltage read by POD2 to PRE2 as it is. If the variable capacitor voltage exceeds the specified limit, the variable capacitor returns to the other limit. The other variable capacitor remains in the same position.

If APRE is high, the motor rotation direction is determined by the CPU unless auto-tuning is being performed.

The logic for PR11 to PR22 is the same as for IC4 and IC5 : BA6109U2. The signal output from the digital unit passes through IC2 and IC3 : TC4066BP and enters IC4 and IC5.

		PR11	PR12	PR21	PR22
Motor 1	Normal rotation	H	L	-	-
	Reverse rotation	L	H	-	-
Motor 2	Normal rotation	-	-	H	L
	Reverse rotation	-	-	L	H

### 3. Manual tuning

Hold down the USB LSB key and switch the power on. Select the menu number 20 with the click encoder, turn the display off with the band down key, and press the CLR key to return to normal mode. Manual tuning is now ready.

The main encoder controls VC1, and the sub-encoder controls VC2. The capacitance of each variable capacitor changes from maximum to minimum when the encoder is given about eight turns.

### 4. Preset tuning

When auto-tuning or manual tuning ends, the position of the variable capacitor is stored in memory by the microprocessor as preset data for that band.

When the band is changed after tuning has been performed in another band, APRE goes high, the motor is controlled by the microprocessor, and preset tuning is performed. During preset tuning, auto-tuning or signal transmission is inhibited even if the AT TUNE switch is pressed or transmission becomes ready.

The initial preset data when the microprocessor is reset includes standard data for a 50Ω load on each band.

## CIRCUIT DESCRIPTION

### Standby Control and Timing

Standby control and timing is performed by the control unit (X53-3380-00). The input control signals are listed below.

- SS : Standby switch. Active low.
- $\overline{SS}$  : Inverted SS. Base for producing each timing voltage.
- CSS : Standby signal to the microprocessor. Active low.
- ATS : Standby signal from the antenna tuner. Active high.
- ESS : Standby signal from the personal computer control. Active high.
- KEY : Keying signal from the keyer. Active low.
- KSW : Signal indicating whether a key is inserted into the key jack. GND : When a key is inserted into the key jack.
- TXI : Transmission disable signal from the microprocessor. Low: Disabled.
- VOXQ : Standby signal from VOX. Active high.

The output control signals are listed below.

- CTXB : Signal that generates TXB (Transmission 15V). Active high.
- TXB : Transmission 15V
- KYB : Keying signal generated by the keyer. Active high.
- CKY : Keying signal with timing. Active high.
- RXB : 15V in receive mode. Same timing as the inverted TXB.
- RBC : Receive control signal with timing. Active low.

Fig. 15 Basic timing chart for standby

### 1. Manual standby (other than CW)

#### • Reception → Transmission

If pin 5 (TXI) of the CWT module (X59-3660-00) is high, transmission is possible when the standby switch is pressed, and the SS line is grounded, Q203 and Q202 in the module turn on and 15V is output to pin 2 from the collector of Q202. The voltage  $\overline{SS}$  passes through pin 4 of IC15 and D27, and enters pin 2 of the TRX module (X59-3680-00) as CTXB. It turns Q153 and Q152 on and generates TXB from pin 5. The collector of Q152 goes high, Q154 turns on, Q155 and Q151 turn off, and RXB from the collector of Q151 goes low.

#### • CKY generation

SS makes pin 2 of IC10 (NAND gate) high, and triggers pin 4, the A input pin, of IC9 (one-shot multi). The  $\overline{Q}$  output is low for 15ms and then goes high. So pin 3 of IC10 goes low 15ms after the standby switch is pressed. Pin 10 of IC11 (inverter) goes high.

Since the CWB signal (high in CW mode) enters pin 13 of IC11, it is low in other modes. So the inverter output pin 12 is always high.

Pin 5 of IC12 (analog switch) is high during full break-in and the switch is on. Pin 13 of IC12 is high during semi-break-in and the switch is on. CKY is output from pins 2 and 3 of IC12 15ms after SS with the same timing for semi-break-in and full break-in.

The CKY signal is output to the outside, and bias is applied to the second transmit mixer. At the same time, the signal goes to pin 4 of the ALC module (X59-3700-00) through D35, passes through integration circuit Q251, which rounds the waveform, and is matched with the negative signal of the ALC to produce the FET gate bias of the transmit IF.

In any mode other than CW, the 15V digital signal for D15 is shorted by Q26 and not input to the ALC module, and the rising edge of the transmission signal is determined by the signal of the integration circuit.

Fig. 16 CKY generation

## CIRCUIT DESCRIPTION

### • TX → RX

When the standby switch turns off, Q203 and Q202 of the CWT module are turned off, and the  $\overline{SS}$  signal goes low. The anode of D27 also goes low, but since there is a 5ms time constant circuit comprised of R103, R104, and C58 for the output of pin 2 of IC15 (inverter), the output of pin 4 of IC15 goes low 5ms after  $\overline{SS}$ .

So the D26 cathode CTXB switches from transmission to reception with this timing, and TXB goes low 5ms after the standby switch is turned off.

When TXB goes low, Q154 in the TRX module turns off, Q155 and Q151 turn on, and RXB goes high.

### • CKY down

When  $\overline{SS}$  goes low, pin 2 of IC10 (NAND gate) goes low, pin 3 goes high, pin 10 of IC11 (inverter) goes low, and the CKY output goes low. This means the CKY goes low when the standby switch is turned off. The ALC waveform output from the ALC module rises, rounded by the time constant of the integration circuit.

Fig. 17 CKY down

### • RBC generation

When CTXB goes low, pins 9 and 11 of IC15 (inverter) go low and pin 4 of IC10 (NAND gate) goes low 12ms after CTXB does. This means RXB goes high by the 12ms time constant circuit (consisting of R105, R106, and C59) for pin 8 of the inverter output.

The RBC signal is fed to the base of the NPN transistor of the signal unit (X57-4130-00). This transistor performs the switching operation to ground the 455kHz receive IF circuit. The receiver operates only when RBC is low.

Fig. 18 RBC generation

### • PLL, DDS data and transmission/reception timing signal

As explained earlier,  $\overline{SS}$  is used at the beginning of each operation. It takes 15ms from  $\overline{SS}$  being grounded until last transmission timing signal CKY is generated. It takes 12ms from RXB going high until RBC goes low. The PLL and DDS data from the microprocessor are operated, and the diode switch and analog switch are switched during that time to assure stable transmission and reception.

## 2. Timing for full break-in operation

### • Generation of TXB by key down

When the key is inserted into the key jack, KSW is grounded, pin 9 of the CWT module is grounded, and the Q208 emitter voltage becomes ground level. When the key is down, Q201, Q208, Q206, and Q207 turn on, and the output of pin 6, KYB, goes high. KYB passes through D20, D30, pins 1 and 2 of IC16 (analog switch), and D28, and makes the  $\overline{SS}$  line high. Q24 is turned on through D34, and  $\overline{CSS}$  is grounded to notify the microprocessor of the start of transmission.

When transmission disable signal TXI is low to disable transmission, Q205 and Q204 of the CWT module are turned on and the CWB line is grounded. Q206 and Q207 turn off, and the KYB line goes low. The  $\overline{SS}$  line remains low.

When the  $\overline{SS}$  line goes high, CTXB goes high through D27, Q153 and Q152 of the TRX module turn on, and TXB is generated. Q154, Q155, and Q151 turn off and RXB goes low.

## CIRCUIT DESCRIPTION

- **CKY generation**

When  $\overline{SS}$  goes high, pin 2 of IC10 (NAND gate) goes high, and the  $\overline{Q}$  output of IC9 (one-shot multi) goes high 15ms after  $\overline{SS}$  goes high. The output from pin 3 of IC10 goes low 15ms after that.

The output from pin 10 of IC11 (inverter) goes high and pin 5 of IC12 (analog switch) goes high when FULL. Pins 4 and 3 conduct, CKY goes high, and the keying signal is sent to the DSP unit.

- **Generation of RXB by key up**

When the key is up, the  $\overline{SS}$  line goes low, and the D27 anode also goes low. At the same time, Q24 turns off, and CSS goes high to notify the microprocessor of the start of reception. In CW mode, Q23 turns on and C57 and C58 are connected in parallel.

Since there is a 15ms time constant circuit consisting of R103, R104, C58, and C57 for the output of pin 2

of IC15 (inverter), the output of pin 4 of IC15 goes low 15ms after  $\overline{SS}$ . So CTXB goes low 15ms after the key is up, and TXB also rises with the same timing.

When TXB goes low, Q154 of the TRX module turns off, Q155 and Q151 turn on, and RXB goes high.

- **CKY down**

During full break-in, Q21 and Q22 turn on the 12ms delay circuit consisting of R99 and C56, and the signal whose key-down is 12ms behind is input to pin 1 of IC10. This signal rectifies the waveform of the signal that is delayed 15ms.

- **RBC generation**

RBC is generated in the same way as in manual standby. RBC goes low 12ms after RXB goes high by key-up. The receiver operates only when RBC is low.

Fig. 19 Full break-in timing chart

## CIRCUIT DESCRIPTION

### 3. Timing for semi-break-in operation

#### • Generation of TXB by key down

When the key is down, the  $\overline{SS}$  line goes high in the same way as for full break-in.

During semi-break-in operation, pin 5 of IC16 (analog switch) goes high and pins 4 and 3 conduct. Q24 turns on through D34, pins 4 and 3 of IC16, and D31 from the  $\overline{SS}$  line, and CSS is grounded to notify the microprocessor of the start of transmission.

TXB is generated from CTXB through D27 from  $\overline{SS}$ .

#### • CKY and transmission hold circuit

The KYB signal produced by key-down triggers the A input, pin 12, of IC9 (one-shot multi), and the Q output, pin 10, is high for a certain period.

Since pin 5 of IC16 (analog switch) is high, pins 4 and 3 conduct. Q24 turns on through D34, pins 4 and 3 of IC16, and D33 from the Q output, and CSS is grounded. CSS is held low for the time determined by the time constant of the one-shot multi or the time constant for semi-break-in.

The KYB signal, having passed through D20, enters pin 11 of IC13 (inverter), passes through pin 8 of IC13 and D24, and enters pin 1 of IC14 (NAND gate).

SS of pin 1 of IC10 (NAND gate) goes high through D33 and pins 4 and 3 of IC16 while the Q output from pin 10 of IC9 is high. SS is held high while IC9 is triggered by the keying signal.

So pin 2 of IC10 (NAND gate) is high. After  $\overline{Q}$  goes high 15ms after  $\overline{SS}$  is triggered for the first time, the A input of IC9 (one-shot multi) goes high unless  $\overline{SS}$  changes. Pin 1 of IC10 goes high, and pin 10 of IC11 (inverter) and pin 2 of IC14 (NAND gate) go high.

For the output of pin 3 of IC14, the signal keyed by KYB is output from pin 2 of IC12 (analog switch) and becomes the CKY signal. When the hold time of IC9 (one-shot multi) elapses after key-up, the Q pin goes low, and  $\overline{SS}$  goes low, returning to reception.

### 4. VOX operation

When IC9 (one-shot multi) is triggered by the output from the VOX module (X59-1080-01) of the AF unit (X49-3050-00), the Q output goes high and is fed to the control unit (X53-3380-00) by harness. Q25 turns on through pins 8 and 9 of IC16 (analog switch) from the VOXQ pin of connector CN20 of the control unit, and the SS line is grounded. Subsequent operations are the same as for manual standby.

Fig. 21 Semi-break-in timing chart

# TS-950SDX

## CIRCUIT DESCRIPTION

### Voice Memory Operation

If the optional DRU-2 is installed, the voice memory can be used.

#### 1. Logic for VOA and VOB

	Recording (microphone signal)	Recording (receive signal)	Monitor (Reception)	Transmission
VOA	L	L	H	H
VOB	H	L	L	H

During recording (microphone signal)

Signals from the microphone are sent to the VI terminal of the DRU-2, and are written into the memory of the DRU-2.

During recording (receive signal)

Main audio signals are sent to the VO terminal of the DRU-2 from the MANO terminal through IC101 (a/4), and are written into the memory of the DRU-2.

During monitoring (reception)

Signals from the DRU-2 are output from the VO terminal, sent to the monitor VR from the MONVR1 terminal through IC101 (b/4), and are monitored.

During transmission

Signals from the DRU-2 are output from VI and sent to the microphone amplifier.

## CIRCUIT DESCRIPTION

### Final Unit

There are three major differences between the TS-950SDX and the TS-950S/SD :

1. The final stage has been changed from transistor (MRF429MP) to FET (MRF150MP).
2. The bias circuit has been modified for the FET.
3. The fan always runs during transmission as in the TS-850 and TS-450/690.

Some constants have been modified to improve the frequency characteristics.

The power MOS FET has a higher gain than the bipolar transistor, so the overall gain of the final unit is made equal to that of the TS-950S/SD by increasing the negative feedback with R19 and R20. Since the MOS FET has a very high input impedance between its source gates, the impedance is reduced by R17 and R18. If the frequency is high, the impedance is reduced by R15 and R16 to prevent oscillation. L5 uses a teflon coaxial cable to make the primary and secondary connections constant and improve efficiency.

The bias circuit is described next. The power MOS FET : MRF150 used in the TS-950SDX shows variations in mutual conductance,  $G_f$ s, and gate threshold voltage,  $V_{GS(th)}$ . The MRF150MP has a pair of FETs with equal  $G_f$ s. The MRF150MP has different  $V_{GS(th)}$ , so each of the FETs needs a bias circuit, which are isolated by C42 to C47.

The bias voltage is produced by D3 and D11, and the bias voltage for each FET is adjusted by VR4 and VR5. Q18 and Q19 supply the bias voltage to each FET, which is not screwed to the radiator because it does not require a large current, unlike the bipolar transistors.

D11 to D13 are for temperature compensation. Since the power MOS FETs have negative temperature characteristics, they do not need temperature compensation because they do not cause thermal crash, unlike the bipolar transistors. However, since there is a bipolar transistor in the bias circuit, the gate bias voltage rises and the idling current increases when the temperature is high. D11 to D13 are provided to prevent this.

### DSP Unit

#### 1. Functions

The DSP unit performs digital signal processing, modulates signals in the SSB, CW, AM, and FSK modes, generates the carrier for frequency modulation, performs PSN detection and AF filtering, and generates two tones for adjustment.

#### 2. Features

The sampling frequency of the TS-950SDX has been changed from 49.189kHz to 44.39024kHz for modulation and 44.4kHz for detection. The IF has been changed accordingly and 11.09756kHz is converted to 455kHz during modulation from the previous D/A first image of 36.891kHz. It is 100kHz during detection to make use of the TS-950SDX frequency configuration.

This increases the number instructions that can be executed in one sampling period, improving performance.

#### • Modulation

Twelfth-degree PSN SSB modulation, CW waveform rectification with a Gaussian response ROM filter, and FSK waveform rectification with a Gaussian response FIR filter are performed by improving the performance of the DSP-10/100. Better sideband suppression is obtained by changing the PSN degree from 10 to 12.

#### • Detection

Good sideband suppression and sound quality are produced by the PSN detection method. The PSN degree for detection is 10, while that for modulation is 12. The AF filter is a FIR filter to reduce noise and provide good characteristics. You can select filters for SSB, CW, and FSK by changing 18 characteristics. The signal-to-noise (S/N) ratio is improved by suppressing noise and interference in the low-frequency range between audio formats during SSB reception and SSB/CW with a linear phase comb filter. (On/off is selected from a menu in SSB.)

# TS-950SDX

## CIRCUIT DESCRIPTION

### 3. Configuration

Figure 23 is a block diagram of the DSP. The DSP consists of the digital unit, which controls and performs digital signal processing; the analog unit, which processes analog signals and outputs them to the digital unit, and converts input from the digital unit to analog signals; and the PLL unit, which generates clock pulses to manage the frequencies with the main unit, and performs digital signal processing with an accurate sampling frequency.

### 4. Flow of signals

The flow of signals in each of the modes is described below.

#### • Modulation

##### 1) Flow of signals to modulation in SSB/AM mode

Fig. 23 DSP unit block diagram

## CIRCUIT DESCRIPTION

### 2) Flow of signals to modulation in CW mode

### 3) Flow of signals to modulation in FSK mode

### 4) Flow of signals after D/A output in each modulation mode

### • Flow of Signals for Detection

### 5. Description of units

#### • PLL unit

The PLL circuit provides the reference for each clock used by the DSP unit. The 10MHz reference frequency is input.

The reference signal amplified by Q9 is compared with the VCO signal divided by PLL IC IC26, and the PLL is locked to 35.51219MHz during modulation and 35.5MHz during detection.

#### • Digital unit

The digital unit consists of digital signal processor DSP : TMS320E15 and peripheral circuits.

# TS-950SDX

## CIRCUIT DESCRIPTION

### 1) DSP

The high-speed processor for digital signal processing generates 25MHz signals for internal clocks and operates on 6.25MHz (160nsec) clocks (1/4 the clock frequency). The DSP executes most instructions, such as 16-bit + 16-bit addition and 16-bit x 16 bit = 32 bit multiplication, in one machine cycle.

It contains a 4-Kword EPROM and 256-word RAM.

It interfaces with the A/D and D/A converters, receives commands from the main unit, and read switches through the gate array connected to the bus.

### 2) Gate array

The single-chip gate array generates internal and external clocks from the internal reference signal from the PLL, interfaces with the analog unit, generates the DSP reset signal, receives commands to the DSP from the main unit, and inputs RTK, CKY, and TXB. It makes the digital unit circuit smaller and improves reliability.

### 3) Other peripheral circuits of the DSP

IC23 provides timing for writing data to the gate array.

IC24 is a power supply voltage detection IC that outputs a low signal to the gate array when the power supply voltage drops. When the power is switched on, the output from this IC is delayed by the gate array and sent to the DSP. Since the clock from the PLL is used for delaying, a reset is output to the DSP if the clock is not input or if the level is insufficient.

Q8 is an amplifier that amplifies the DSP reference signal to the gate array input level.

Q6 converts the TXB level. The TXB whose level is converted is supplied to the analog unit about 14ms when reception is switched to transmission.

### • Analog unit

The analog unit interfaces between analog and digital signal processing via the audio A/D and D/A converters.

### 1) High-pass filter

The high-pass filter for modulation processing is not a digital filter, but an analog one because of the processing capability of the DSP, and uses the same characteristics for modulation and detection. The cut-off frequency (-3 dB) can be obtained by the following Butterworth Filter.

$$F_c = 1/2 \cdot \pi \sqrt{R_a \cdot R_b \cdot C_a \cdot C_b} \quad (C_a = C_b)$$

The high-pass filter allows the cut-off frequency to be changed in four steps by switching the resistance with the analog switch. The high-pass filter setting is determined by the overall cut-off characteristics of the notch filter and high-pass filter during SSB modulation. When the notch filter is off, or during AM modulation or detection, the cut-off of the high-pass filter is used. Table 7 lists high-pass filter positions and cut-off frequencies.

HPF position	MH0	MH1	HPF cut-off
100Hz	1	1	55Hz
200Hz	0	1	135Hz
300Hz	1	0	300Hz
400Hz	0	0	400Hz

Table 7 High-pass filter cut-off frequencies

### 2) Limiting amplifier

If a signal with an amplitude larger than the input amplitude enters the A/D converter, very large distortion occurs. To prevent this, the amplitude is clipped by a limiting amplifier to limit the amplitude so that the input level for the A/D converter does not exceed the full scale for the A/D input.

The operational amplifier in the HIC is used as the limiting amplifier. If the amplitude exceeds about  $\pm 1.6V$ , it is clipped by IC9.

## CIRCUIT DESCRIPTION

### 3) AAF and SMF

If the sample-and-hold amplifier input has a component of  $1/2$  the sampling frequency  $f_s$  (Nyquist band), it causes loopback distortion that cannot be removed by a filter. The low-pass filter that removes the components outside the Nyquist band is called an anti-aliasing filter (AAF).

This filter has roughly 6.3kHz cut-off frequency to prevent undesirable effects on the amplitude and group delay characteristics of the 3kHz transmission band. It is an active filter having five-degree simultaneous Chebyshev characteristics as the minimum characteristics to remove the components outside the Nyquist band.

The harmonics in the audio output are reduced by a smoothing filter (SMF). It is the same HIC as the AAF.

The HIC circuit uses a low-noise, low-distortion FDNR filter designed for audio equipment.

### 4) Limit cycle suppression signal

The MF10 signal from the gate array is divided by IC13, the level is reduced, and goes to the A/D converter to suppress the zero input limit cycle generated from the low-pass filter during SSB modulation. This signal is off if the DSP notch filter is through.

Since this signal is set to the attenuation limit of the notch filter, it does not leak to the modulation output.

### 5) S/H amplifier and A/D converter

Since the A/D converter converts signals serially, the input level must be constant during conversion. Before the A/D converter converts, the sample-and-hold (S/H) amplifier samples the input signal and outputs a stepwise signal.

The 100kHz signal is input during detection, but the 11.1kHz output spectrum appears at the basic level due to the sampling theorem, as if the 11.1kHz IF were input.

If the SH signal from the gate array is high, Q1 turns on, and sampling is performed as an amplifier with a gain of zero. If the signal is low, Q1 turns off, and the sampled value is held. Output resistors for IC10/1 and IC16/1 are provided to protect the operational amplifier. D2 shifts the SH level from 0/5 to  $-5/0$ .

### 6) D/A converter circuit

The 16-bit serial digital signal from the digital unit is converted to an analog signal by the D/A converter. The output is converted by the chopper circuit with a 50% duty in modulation mode. The D/A converter output is transmitted as it is during AF-SLOPE. The frequency characteristics are improved by taking the output with a 50% duty during modulation processing due to the aperture effect. This operation is the same as the operation of the audio deglitcher.

### 7) D/A low-pass filter (for modulation)

Since the low-pass filter for detection has a low cut-off frequency, a 24kHz low-pass filter is used for modulation. It has broad characteristics, and the output contains many harmonics, but they are removed by a ceramic filter.

## CIRCUIT DESCRIPTION

### 8) Mixer

Multiplication is performed by turning the analog switch on and off at 443.9024kHz to convert to 455kHz with addition to 11.09756kHz.

### 9) Band-pass filter (455kHz)/amplifier

Undesired components of the converted 455kHz signal (D/A output components not removed by the low-pass filter; image and harmonics in the mixer) are removed by the 455 ± 5kHz ceramic filter.

### 10) A/D converter input switching

Analog switch IC8 switches the MIC input to the AAF, and turns the RIF input H on and off.

Signal		Input to AAF	Input to RIF A/D
NTX	MHZ		
0	0	HPF	OFF
0	1	HPF through	OFF
1	X	OFF	ON

Table 8 IC8

### 11) DAF output on/off

### 6. Frequency relationship

#### • During modulation

$$f_{DSPSTD} = (728/205) \times 10 \times 10^6$$

$$f_{MIX} = f_{DSPSTD}/80, f_s = f_{DSPSTD}/800$$

$$f_{455} = f_{MIX} + 1/4 \cdot f_s = 41/3200 \cdot f_{DSPSTD}$$

#### • During detection

$$f_{DSPSTD} = (128/36) \times 10 \times 10^6$$

$$f_s = f_{DSPSTD}/800$$

$$f_{100} = 9/4 \cdot f_s = 9/3200 \cdot f_{DSPSTD}$$

### 7. Digital signal processing specifications

### Digital Control Unit

The TS-950DX digital control circuit has a multiple chip configuration centered around IC8 :  $\mu$ PD 78C10AGQ, and consists of a 64K ROM (IC19 : M27C512B), an 8K RAM (IC18 : LC3564PML), and an I/O port (IC3, IC6, IC7 : MB89363B). This circuit controls about 150 different input and output signals.

## CIRCUIT DESCRIPTION

Fig. 24 Digital control block diagram

# TS-950SDX

## CIRCUIT DESCRIPTION

### 1. Encoder circuit

The main encoder and sub-encoder are magnetic rotary encoders, and the click and RIT/XIT encoders are contact-type rotary encoders.

Encoder pulses enter the gate array (LZ92K371), and are read through the CPU bus. The gate array is selected by CSIO4 or CSIO5, and the CK1, CK2, or CK3, CK4 encoder is selected by A0.

Encoder data is output to D0 to D7 by making RD active when the chip select signal is active. IC22 rectifies the waveforms of the click and RIT/XIT encoder pulses.

Fig. 25 Encoder circuit

### 2. System reset and RAM backup

The power monitor IC (IC17 : MB3780A) monitors the power supply voltage. If the voltage is low, the IC outputs a RESET signal to the CPU and I/O to stop operation and back up the RAM with a lithium battery.

When the power supply voltage becomes normal (including power on), the reset is canceled, the CPU and I/O are initialized after the time constant set by C258 and C259, and operation resumes. Power is supplied to the RAM from the outlet.

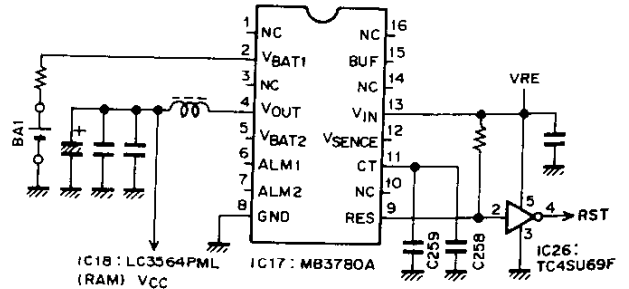

Fig. 26 System reset and RAM backup

## CIRCUIT DESCRIPTION

### 3. Address control

Since PD0 to PD7 of the main CPU carry multiplexed address and data signals, the address signal is separated from the data signal by latching the address signal using the ALE signal from IC12 : TC74HC573AF. PF0 to PF7 represent the high-order byte of the address.

The address signals of A9 to A15 are used as chip select signals for each IC by address decoder IC14 and IC16 : TC74HC138AF and IC15 : TC74HC148AF.

Fig. 28 Memory map

Fig. 27 Address control circuit

# TS-950SDX

## CIRCUIT DESCRIPTION

### 4. Analog signal input

The main CPU incorporates an 8-channel analog-to-digital (A/D) converter, and also has IC10 : MB4056 (A/D) and IC11 (analog switch) for entering 13-channel analog signals. Incoming analog signals are digitized and handled digitally.

IC8 :  $\mu$ PD78C10AGO (CPU)

Port name	Signal name	Description
AN0	RWM	Reflected wave voltage
AN1	AGC	AGC meter voltage
AN2	MET3	ALC/lc volume voltage (switched by ALMS)
AN3	-	Not used
AN4	MET1	S/RF meter voltage (switched by TXB)
AN5	-	Not used
AN6	PRM	Processor meter voltage
AN7	SBMET	Sub S-meter voltage

IC10 : MB4052 (A/D converter)

Port name	Signal name	Description
A0	RMC	RM-1 (external keyboard) voltage
A1	POD1	AT variable capacitor 1 voltage
	POD2	AT variable capacitor 2 voltage
A2	PIT	PITCH volume voltage
	VBT	VBT volume voltage
A3	SLL	Slope tune low-cut volume voltage
	SLH	Slope tune high-cut volume voltage

IC11 : TC4053 switches between A1, A2 and A3.

**Table 11 Analog signal input**

### 5. Display

Since the TS-950SDX uses a combined fluorescent display tube and meter, a new sub-CPU for the display drive has been developed. The sub-CPU is located on the display unit, and is controlled by serial commands from the main CPU.

The load on the main CPU can be decreased by making the main CPU send display data and control data to the sub-CPU as serial commands, since the sub-CPU lights the fluorescent display tube dynamically.

The sub-CPU lights the fluorescent display tube dynamically according to the command data from the main CPU. Since there are 24 grids, including the meter and sub reception frequency, and the display scan speed is not sufficient, the grids are divided and scanned at high speed to avoid flickering. The sub-CPU not only drives the display, but also performs other processing, such as repeater subtone synthesis, beep tone generation, and LED display. The power required to light the display is supplied from the AVR unit.

The dimmer functions by varying the lighting duty of the gate array output. A display-enable signal is output from the LH pin (CN5 pin 3) of the display unit each time one segment is displayed. This signal changes the duty continuously with the timer/event counter of the main CPU, and changes the brightness by the gate array.

| (9) G9 : Units digit in Mch  |                | G19 : MAIN VFO 100kHz                        |
| (10) G10 : Tens digit in Mch |                | G20 : MAIN VFO 1MHz                          |
| (11) G23 : Upper meter       |                | G21 : MAIN VFO 10MHz                         |
| (12) G23 : Upper meter       |                | G22 : Filter select                          |
| (13) G24 : Lower meter       |                | One of G11 to G21 (Analog scale red pointer) |
| (14) G24 : Lower meter       |                | One of G11 to G21 (Analog scale red pointer) |
| (15) No display              |                | All G11 to G21 (Analog scale)                |
| (1) Repeat from (1)          |                |  |

In (11) to (14), the meters (upper and lower) and analog scale red pointer light twice to increase the intensity. There is a blanking time (whole display off) when the display is switched during each scan. The lighting period is approximately 520 μs (Display illuminated: approximately 470 μs; blanking: approximately 50 μs).

Fig. 29 Timing chart for display lighting (grid only)

# TS-950SDX

## CIRCUIT DESCRIPTION

### 6. PLL and DDS data

The TS-950SDX has 8 + 1 PLLs (one for the DSP) and 2 DDSs. The CPU sends data to the PLLs and DDSs according to the displayed frequency. The PLL ICs provide unlock data signals. If one of the PLLs should unlock, the display indicates fact.

Loop			VCO No.	IC	Ref. frequency/ Ref. division ratio	Variable division ratio	VCO oscillator frequency	Input terminal	Unlock signal
MAIN	LO1	High-order	VCO1	AF unit (X49-3050-00) IC11 : CXD1225M	500k/20	76-136	73.06-103.05MHz	FMI (11 pin)	A0 (8 pin) "H" : Unlock

Table 12 PLL and DDS data

## CIRCUIT DESCRIPTION

### 7. Key scan

The P0\* and P1\* ports of IC7 form a keyboard matrix. A key scan signal (a negative pulse) is output from the P1\* port. One column corresponding to the P0\* port is selected, and the state of the corresponding

switch is read. When the switch at the intersection of the matrix is pressed, the P0\* port bit goes low. Thus, which switch is pressed can be detected. Keys are debounced by software.

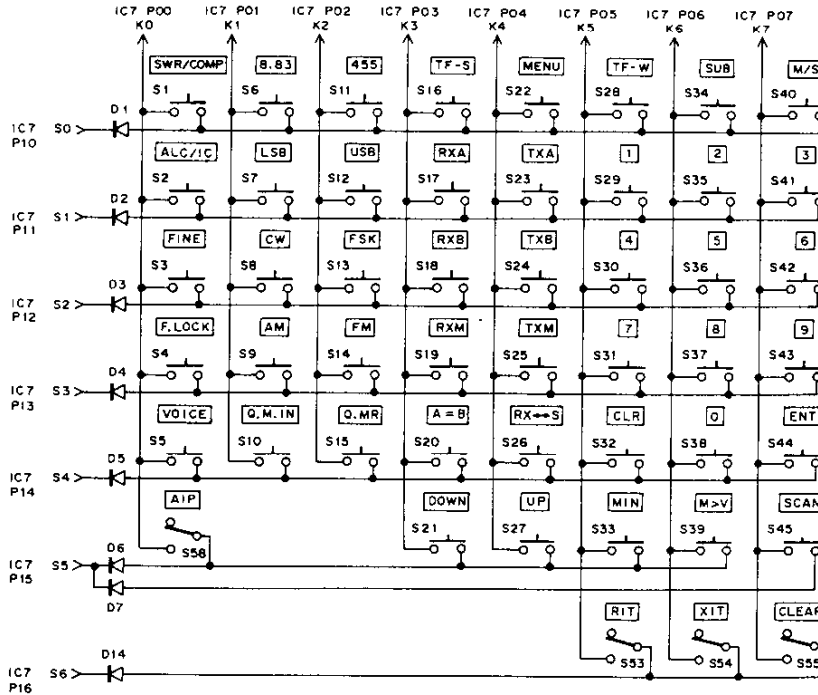

Fig. 31 Key matrix

### 8. Bandscope signal

Station monitor SM-230 can be connected to the TS-950SDX. The sub reception frequency can be displayed as an intensity marker point on the SM-230 tube by the simultaneous two-wave reception function of the main unit.

The digital unit outputs the difference between the main operation frequency and sub operation frequency to the SM-230. The TS-950SDX receives bandscope scan width data from the SM-230, and outputs the sub reception frequency point at the position specified by the sweep width when the center of the tube is the main receive frequency. It then displays it by the intensity marker on the SM-230.

The resolution for each scan width is divided and sent by 100 digits to the right and 100 digits to the left from the center of the tube (a total of 200 digits).

$$\pm 25\text{kHz} : 50\text{kHz}/200 = 250 \text{ Hz resolution}$$

The main CPU controls the main frequency and sub reception frequency, calculates the direction of the sub reception frequency to the main frequency (right or left from the center of the tube) and the difference frequency between them. This is processed by the D/A

converter, buffered, and output as a digital value according to the range and resolution. It is output to the SCOPE pin.

SMKC is the on/off signal for sub reception. This signal turns the intensity marker on and off so that there is no unnecessary intensity point when the sub receiver stops. The output is grounded by the open collector when the sub receiver is turned on.

Fig. 32 Bandscope signal

## CIRCUIT DESCRIPTION

### 9. Electronic keyer

The electronic keyer is controlled by transferring 8-bit commands serially. The commands include automatic electronic keyer correction, automatic correction reversal, bug key mode setting, manual weight setting, and recording/playback setting.

The electronic keyer has a variable weight function. The dot : dash : space ratio for the normal CW code is fixed at 1 : 3 : 1, but it can be changed.

When auto-weight is off, the ratio of dash to dot can be set by setting the manual weight. By default, dot : dash : space is 1 : 3 : 1, so the same code as for the normal electronic keyer can be output.

When auto-weight is set to on, the ratio of dash to dot interlocked with the KEY SPEED VR can be set automatically. As the keying speed increases, the speed can be varied so that dash is lengthened or shortened. It is turned on and off with the REV switch.

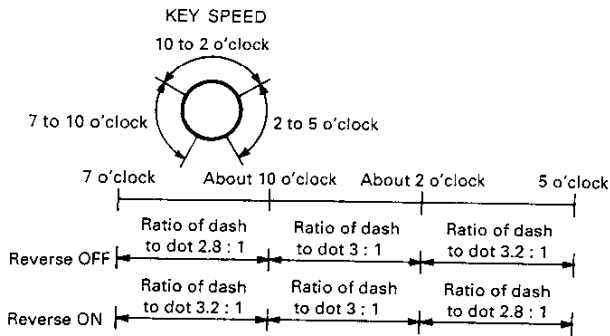

Fig. 33

### 10. AT control

The AT is controlled by the variable capacitor position data (POD1, POD2, analog data input), motor normal/reverse rotation control (PR11, PR12, PR21, PR22), motor speed control (SPED), motor control switching (APRE), progressive wave for SWR calculation, and reflected wave voltage (VSFM, VSRM analog data input).

SPED switches the motor rotation on and off during AT tune and presetting by PWM using a duty cycle related to the SWR value.

APRE changes the motor normal/reverse rotation control to analog control for AT tune, and to digital control for presetting.

PR performs motor normal/reverse rotation control and stop control when motor normal/reverse control is performed digitally.

### 11. IF filter switching

(455kHz : Signal unit, 8.83MHz : IF unit)

The IF filter switching signal from the digital unit is sent to the signal unit as 10-bit serial data. The serial-to-parallel converter (TC9174F) in the signal unit converts the serial data to parallel data to select the 8.83MHz or 455kHz IF filter.

### 12. PLL VCO data

The AF, PLL unit switches VCOs according to the VCO band data (MVBA to MVBD: main; SVBA to SVBD: sub) from the digital unit.

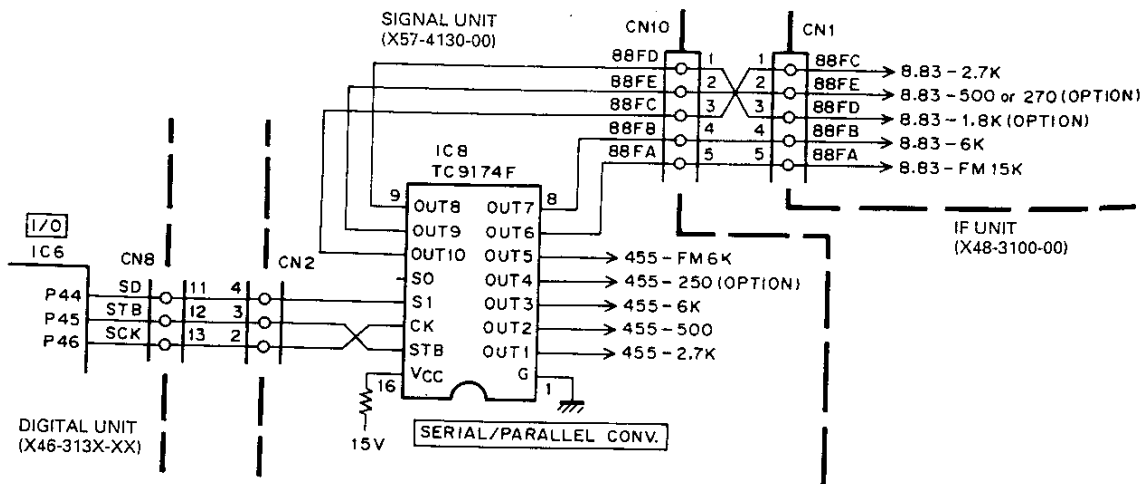

Fig. 34 IF filter switching

## CIRCUIT DESCRIPTION

### 13. Receive band-pass filter selection

The RF band-pass filter signal (RB0 to RB3) from the digital unit is buffered by Q2 and Q3 of the digital unit,

then sent to the RF unit. The RF unit obtains RF band-pass filter data using BCD-to-decimal decoders.

Fig. 35 Receive band-pass filter selection

### 14. Transmit low-pass filter, AT band data

Transmitter system band data (LP0 to LP3) from the digital unit is buffered by Q5 and Q6 of the digital unit, then sent to the filter unit. The filter unit obtains TX

low-pass filter data and AT band data using BCD-to-decimal decoders.

Fig. 36 Transmit low-pass filter, AT band data

## CIRCUIT DESCRIPTION

### AVR Unit

The AVR unit produces +15V thru the use of a discrete IC; +5V and -12V via 3-pin regulator IC's, and 40B thru the use of a zener diode and transistor.

The +15V circuit is a very similar to the +28V circuit of the TS-940. When the power is switched on, Q2 is turned on via start resistors R3 and R24 and current flows. A voltage is generated at R8 and R9. Error amplifier transistor Q4 is turned on while Q1 is turned on.

The circuit operates as a constant-voltage circuit with a reference voltage of 7.5V which is produced by zener diode. Diode D2 (negative temperature coefficient) is used to compensate for the temperature (positive temperature coefficient) of this zener diode. A current of up to 5.5A flows through Q2, resulting in a collector loss of approximately 35W. R4 is a resistor that is used for stabilization, and has a current flow of approximately 100mA to stabilize operation even if there is no load.

If the +15V line is shorted, F1 (7.5A quick-blow fuse) blows to protect the circuit.

The +5V is generated from the +15V line by a 3-pin regulator IC.

-40V is produced by two -20V zener diodes, and boosted by Q5. R13 is a protection resistor, and R14 and R23 are resistors for discharging C30 and C34.

When the temperature of the power supply radiator reaches 50°C, thermal switch S2 is turned on, and a fan start voltage of approximately 7V is generated by D4. The fan begins running at a low speed. When the temperature of the transformer rises to 80°C, S1 turns off, and Q3 turns on. The fan voltage then becomes approximately 12V, and the fan rotates at high speed, while a power down signal (approximately 5V) is output (CN5-1, TPT).

## DESCRIPTION OF COMPONENTS

### SWITCH UNIT (A) (X41-3240-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC101	Analog switch	3-4-5, 10-11-12 : DRU-2 signal select.
Q1	Driver	FM LED. Active 'H'
Q2	Driver	AM LED. Active 'H'
Q3	Driver	CW LED. Active 'H'
Q4	Driver	USB LED. Active 'H'
Q5	Driver	LSB LED. Active 'H'
Q6	Driver	FSK LED. Active 'H'
Q7	Driver	TX-A LED. Active 'H'
Q8	Driver	RX-M LED. Active 'H'
Q9	Driver	RX-A LED. Active 'H'
Q10	Driver	TX-M LED. Active 'H'
Q11	Driver	TX-B LED. Active 'H'
Q12	Driver	RX-B LED. Active 'H'
Q13~15	Driver	Key pad LED. Active 'H'
Q17	Buffer	
Q101	Switching	Audio mute.
Q102,103	Switching	MIC audio mute.
Q104	Switching	STBY.
Q105	Switching	Audio input select.
Q106	Switching	ALC.
D1~7	Reverse current prevention	
D8	LED (Yellow)	AIP. Active 'L'
D9	LED (Yellow)	SUB. Active 'H'
D10	LED (Orange)	AT TUNE. Active 'H'
D11	LED (Red)	ON AIR. Active 'H'
D12	Reverse current prevention	For protection D8.
D13	Reference voltage	10V.
D14	Reverse current prevention	
D101	Switching	VOA/VOB.

### AVR UNIT (X43-3070-01)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	+5V AVR	+5V voltage supply for digital unit.
IC2	+5V AVR	+5V voltage supply for PLL unit.
IC3	+5V AVR	+5V voltage supply for DSP unit.
IC4	-12V AVR	-12V voltage supply for each PC board.
Q1	Pre-drive	Drive to Q2 device.
Q2	Series-passed transistor	+15V voltage supply for each PC board.
Q3	Fan motor "HIGH" switch	Fan motor turned to "HIGH" position.
Q4	An error amplifier	Amplified voltage error of the +15V voltage supply.
Q5	-40V AVR	-40V voltage supply for FL tube.
Q101,102	Switching	On when over-voltage.
D1	Voltage rectifier	Base bias for Q1.
D2	Temperature compensation	Cancel to D1 voltage change from temperature changing.
D3	+15V AVR reference voltage	+7.5V.
D4	Fan turned start voltage	Make a voltage when the fan turned on.
D5	Voltage rectifier	-40V.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
D6	Voltage rectifier	-12V.
D7,8	Occur -40V voltage	-20V x 2
D9	Voltage rectifier	+58V voltage for final unit.
D10	Voltage rectifier	+15V.
D101	Reverse current prevention	
D102	Reference voltage	15V
D103	Protection	On when over-voltage. The fuse will blow when 15V line short.

### RF UNIT (X44-3140-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1,2	Band information decoder	Open collector. Active 'L'
Q1-3	RF AGC amplifier	
Q4	AIP amplifier	
Q5,6	RF amplifier	
Q7	Buffer	
Q8-11	RX sub 1st mixer	Convert receive frequency into 40.055MHz.
Q12	Buffer	
Q13-16	RX main 1st mixer	Convert receive frequency into 73.05MHz.
Q17	Sub VCO amplifier	
Q18	Main VCO amplifier	
Q19	TX drive amplifier	RF output of RF unit : 10dBm or more.
Q20,21	TX 3rd mixer	Convert 73.05MHz into transmission frequency.
Q22	TX amplifier	
Q23	Switching	When RB3 become 'H', output to 'L'.
Q24	Switching	On in monitor operation.
Q25	Switching	On in AT tune.
Q26-28	Switching	Transmission filter select.
Q29-31	Switching	AIP turned on and off select.
Q32	Switching	On in monitor operation.
Q33-35	Switching	Bias of mixer circuit select.
Q37	Switching	ATT in monitor operation.
D1,2	Relay surge voltage absorption	D1 : 10dB ATT, D2 : 20dB ATT.
D3	Voltage regulator	Voltage supply of IC1 and IC2 (5V).
D4,5	Lightning surge protection	
D6-35	Switching	RX BPF select.
D36	Switching	Marker circuit switch.
D37,38	AF AGC	AGC circuit pin diode.
D39	Switching	Frequency range 0.5MHz less and more select.
D40	Voltage shift	

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
D41	Voltage regulator	
D42-45	Switching	AIP turned on and off select.
D46,47	Reverse current prevention	
D48,49	Switching	Monitor turned on and off select.
D50,51	Switching	Main VCO transmission and receive select.
D52-57	Switching	TX BPF select.
D58-60	Reverse current prevention	TX mixer circuit bias.
D61	Reverse current prevention	Decide to gain of the power control or AT tune.
D62	Reverse current prevention	
D63	Lightning surge protection	
D64	Switching	Marker circuit switching.
D65	Temperature compensation	
D66	Switching	RX BPF select.

### FINAL UNIT (X45-3450-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1	Pre-drive amplifier	HF band wide range amplifier.
Q2,3	Drive amplifier	HF band push-pull wide range amplifier.
Q4	Final amplifier	HF band push-pull wide range amplifier.
Q6	Drive bias voltage supply	
Q8-10	AVR	Final +48V. 
Q11-13	Switching	Fan motor control. (Voltage supply electro-capacitor discharge circuit)
Q14,15	Switching	Transmission stop when irregular voltage of 50V. 
Q16,17	Switching	Fan motor control. (Voltage supply electro-capacitor discharge circuit)
D1	Temperature compensation	Pre-drive temperature detection.
D2	Temperature compensation	Drive temperature detection.
D3	AVR	Gate voltage occur.
D4	15V voltage detection	
D5,6	Reverse current prevention	
D7	Switching	Transmission stop when irregular voltage of 50V.
D8	AVR	50V AVR reference volatge.
D9	Surge absorption	For fan motor.
D10	AVR	Voltage drop protection when S1 switch turned on.
D11	Temperature compensation	Final temperature detection.
D12,13	Temperature compensation	Compensation of Q18, 19.

# IS-950SDX

## DESCRIPTION OF COMPONENTS

DIGITAL UNIT (X46-313X-XX) 0-11 : K,P 0-21 : M 0-71 : X 2-71 : E,E3,T 2-72 : E2

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	EEPROM	4129 bit, adjustment data memory.
IC2	Operation amplifier	SM-230 sub marker buffer.
IC3	I/O port	8 bit x 3 x 2.
IC4,5	AND gate	PLL clock, data buffer.
IC6,7	I/O port	8 bit x 3 x 2.
IC8	CPU	8 bit microprocessor.
IC9	Inverter	Personal computer interface I/O buffer.
IC10	A/D converter	8 bit, 8 channel.
IC11	Multiplexer	A/D data switching.
IC12	Address latch	Multiplexer address/data latch of data output.
IC13	Chip select decoder	Chip select mixer for RAM.
IC14,16	Address decoder	Convert address signal into each IC chip select signal.
IC15	Chip select decoder	Chip select mixer for ROM.
IC17	System reset/backup select	Reset signal generator. Backup voltage supply select of IC13 RAM.
IC18	RAM	8 bit x 8192 (8 Kbyte)
IC19	ROM	8 bit x 65536 (64 Kbyte)
IC20,21	Encoder gate array	Pulse count of encoder.
IC22	Schmitt trigger	Chattering absorption of encoder.
IC23	NAND gate	Oscillator for electronic keyer speed.
IC24	CPU	4 bit microprocessor for electronic keyer control.
IC25	EEPROM	1 bit x 2048 EEPROM for electronic keyer message memory.
IC26	Inverter	Reset logic invert.
Q1	Signal switching	SM-230 sub marker (SMKC).
Q2,3	Signal switching	RX band signal (RB0~RB3).
Q4	Signal switching	AIP signal.
Q5,6	Signal switching	TX band signal (LP0~LP3).
Q7~9	Signal switching	SUB, AT, AIP LED signal.
Q10	Signal switching	TX band indicate signal (TXI).
Q11~13	Signal switching	AGC speed signal (AGO, AGM, AGS).
Q14	Signal switching	Meter select (ALMS).
Q15~17	Signal switching	Mode signal (SSB, CW, FSK, AM, FM, DATA).
Q18	Signal switching	Mode signal (LSB), 500kHz marker signal (CARS).
Q19~21	Signal switching	AT control (PR11, PR12, PR21, PR22, APRE, SPED).
Q22	Signal switching	TX control (KEY line).
Q23	Signal switching	DSP attenuator (MATT).
Q25	Signal switching	DSP B signal (DB).
D4	Protection diode	AT through/auto switch.
D7,8	Protection diode	MIC down/up switch.
D11~18	Switching	Destination select.
D20,21	Protection diode	Dash/dot switch.
D22	Protection diode	KEY line.
D23	Protection diode	Sub meter voltage-over.

### IF UNIT (X48-3100-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	SUB receive detection	Convert IF 10.695MHz into AF level. 
IC300	Operation amplifier	Main and sub S-meter.
Q1	Sub IF amplifier	40.055MHz.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q2,3	Sub 2nd mixer	40.055MHz → 10.695MHz.
Q4	Switching	On in transmit mode. 
Q5	Sub IF amplifier, NB gate	10.695MHz.
Q6	Switching	Turned off when main and sub NB1, NB2 and SRBK pulse occur. 
Q7	Switching	Turned on when SRBK pulse occur.
Q8	Switching	Turned on when main and sub NB1, NB2 pulse occur. 
Q9,10	Sub IF amplifier	10.695MHz.
Q11	Buffer	10.695MHz AGC.
Q12	Sub AGC amplifier	
Q13	Sub 2nd local amplifier	50.75MHz.
Q14	Main IF amplifier	73.05MHz
Q15,16	Main 2nd mixer	73.05MHz → 8.83MHz.
Q17,18	Switching	Turned on when MRBK pulse occur. 
Q19,20	Main 3rd mixer	8.83MHz → 455kHz.
Q21	Switching	Turned off when MNG2 and sub NB2 occur. 
Q22	Switching	Turned on when MNG2 and sub NB2 occur. 
Q23	Buffer	73.05MHz for IF OUT 1.
Q24	Mixer	73.05MHz → 8.83MHz for IF OUT 1.
Q25	Main LO2 amplifier	64.22MHz.
Q26	Buffer	10.695MHz for sub NB.
Q27-29	Amplifier	10.695MHz for sub NB.
Q30	AGC amplifier	Sub NB.
Q31	Buffer	Sub NB1.
Q32	Switching	Sub NB2.
Q33,34	Switching	Sub NB1. 

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q35	Switching	Sub NB2.
Q36,37	TIF 2nd mixer	8.83MHz → 73.05MHz.
Q38	TIF amplifier	8.83MHz ALC.
Q39	Main LO3 amplifier	8.375MHz.
Q40	TIF amplifier	8.83MHz.
Q41	TIF 1st mixer	455kHz → 8.83MHz.
Q42	AF amplifier	Phone patch. 
Q44	Buffer	73.05MHz.
Q45	Switching	Turned on when SRBK pulse occur.
Q46	Switching	Turned on when TX/RX select.
Q300~302	Switching	Sub IF filter select.
D1,2	Switching	Sub NB.
D3	Sub AGC detection	
D4	Reverse current prevention	Main AGC.
D5~8	NB gate.	
D9	Voltage regulator	NB gate.
D10	Reverse current prevention	NB gate.
D11	Reverse current prevention	Main NB and sub NB pulse synthesis.
D12	Switching	On in receive mode.
D13~17	Switching	Filter select.
D18	Switching	On in transmit mode.
D19~27	Switching	Filter select.
D28,29	Switching	On in receive mode.
D30	Reverse current prevention	NB2.
D31	switching	On in transmit mode.
D32	Noise blanker detection	Sub NB2.
D33	Noise blanker detection	Sub NB1.
D34	Reverse current prevention	CKY.
D35	Voltage regulator	CKY.
D36	Voltage shift	CKY.
D37,38	Switching	On in transmit mode.
D39	switching	On in receive mode.
D40	Relay surge absorption	Linear amplifier relay.
D42	Voltage shift	Linear amplifier relay.
D43	Reverse current prevention	PSQ.
D44	Switching	Discharge.
D300~305	Switching	Sub IF filter select.

### AF UNIT (X49-3050-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	Driver (2 x 1/10)	AF VBT clock and sidetone frequency occur.
IC2	Switched capacitor filter x 2	Main and sub AF VBT.
IC3	Switched capacitor filter x 1	Sidetone filter.
IC4 (a/4)	AF select switch	On in DSP operation (Main SSB and CW).

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC4 (b/4)	AF select switch	On in DSP operation (Main SSB and CW).
IC4 (c/4)	AF select switch	Off in DSP operation (Main SSB and CW).
IC4 (d/4)	AF select switch	On in receive mode (Sub AF).
IC5 (a/4)	AF select switch	On in CW AF VBT operation (When main are not using to AF VBT).
IC5 (b/4)	AF select switch	On in CW AF VBT operation (When sub are not using to AF VBT).
IC5 (c/4)	AF select switch	On in CW AF VBT operation (When main are using to AF VBT).
IC5 (d/4)	AF select switch	On in CW AF VBT operation (When sub are using to AF VBT).
IC6 (a/4)	Siditone on and off switch	On in CW mode.
IC6 (b/4)	Monitor AF short switch	Receive mode or monitor switch is turned off : short.
IC6 (c/4)	AF select switch	On without FM mode (AF for monitor without FM mode).
IC6 (d/4)		Unused.
IC7 (a/2)	AF amplifier	Main AF.
IC7 (b/2)	AF amplifier	Sub AF.
IC8 (a/2)	AF amplifier	Main, Sub, and monitor mixing.
IC8 (b/2)		Unused.
IC9	One shot multi vibrator	Make a VOX delay time. 3 : CD (Input) 4 : A (Input) ; GND 5 : B (Input) 6 : Q (Output)
IC10 (a/4)	FM MIC amplifier output select switch	On in FM WIDE mode.
IC10 (b/4)	FM MIC amplifier output select switch	On in FM NARROW mode.
IC10 (c/4)	AF select switch	On in FM MONITOR mode (AF for FM monitor).

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC10 (d/4)	AF select switch	On in transmit mode (AF monitor).
IC11	PLL1 (Main LO1) (500kHz step 30MHz coverage)	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 11 : 38~68MHz input.
IC12	Mixer (MIX1)	5 : 73.06~103.05MHz input. 11 : 35.05~35.55MHz input. 13 : 38~68MHz output.
IC13	PLL0 (Main LO2)	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 12 : 64.22MHz input.
IC14	AVR	10V (in the AF unit).
IC15	AVR	5V (in the AF unit).

Q1	AFT amplifier	80kHz ± 50kHz.
Q2	Switching	On when DSP operation.
Q3	Switching	On in FSK or SSB mode.
Q4	Switching	On in AF VBT operation.
Q5	Switching	On in CW mode.
Q6	Muting	On when no sidetone output.
Q7	Muting	On when insert a key plug into jack.
Q8	Muting	On in transmit, MABK and SQ mode (Main mute).
Q9	Muting	On in transmit, SABK and SQ mode (Sub mute).
Q10	AF amplifier	Main REC OUT.
Q11	AF amplifier	Sub REC OUT.
Q12	Muting	When power switch is turned on or off, mute in TX/RX.
Q13	Switching	On for instant when power switch is turned on.
Q14	Switching	On in CW and FSK mode.
Q15	AF amplifier	For sub-tone.
Q16	Muting	On in receive mode (Muted to FM MOD line when receive mode).
Q17,18	Switching	On in FM NARROW mode.
Q19	Switching	On in FM mode.
Q20	AF amplifier	FM MIC signal.
Q21	Switching	On in FM mode.
Q22	Switching	On in FM mode.
Q23	Switching	On in FM mode.
Q24	Switching	VCO select (10kHz~7.5MHz : on).
Q25	Switching	VCO select (7.5MHz~14.5MHz : on).
Q26	Switching	VCO select (14.5MHz~21.5MHz : on).
Q27	Switching	VCO select (21.5MHz~30MHz : on).
Q28	Switching	Unlock detection (PLL0, 1).
Q29~31	PLL1 low-pass filter	Active filter (reference frequency 500kHz).
Q32	VCO1 output amplifier	73.06~103.05MHz.
Q33	MIX1 input buffer	73.06~103.05MHz.
Q34,35	MIX1 output buffer	38~68MHz.
Q36	MIX1 input buffer	35.05~35.55MHz (Main LO1).
Q37	Main LO1 output buffer	73.06~103.05MHz.
Q38	REF buffer	10MHz (Reference of PLL IC).
Q39	Main LO2 output buffer	64.22MHz.
Q40	Buffer	8.83MHz for main NB.
Q41,42	Amplifier	8.83MHz for main NB.
Q43	AGC amplifier	8.83MHz for main NB.
Q44	amplifier	8.83MHz for main NB.
Q45	Buffer	Main NB1.
Q46	Switching	Main NB2.
Q47,48	Switching	Main NB1.
Q49	Switching	Main NB2.

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q51	Switching	On in CW mode (CWB).
Q52	Switching	On in CW mode.
Q53	Muting	On when no sidetone output.
D1,2	Reverse current prevention	
D3	Reverse current prevention	FSKC, SSBC.
D4	Reverse current prevention	CWC.
D5~8	Reverse current prevention	
D9	Reverse current prevention	KEY.
D10	Reverse current prevention	
D11	Reverse current prevention	RBC, SABK
D12	Reverse current prevention	RBC, SQ.
D13	Reverse current prevention	MABK.
D14,15	Reverse current prevention	
D16	Reverse current prevention	VOXDL.
D17	Reverse current prevention	
D19	Reverse current prevention	FSKC, CWC.
D21	Reverse current prevention	FMNC.
D22	Reverse current prevention	
D23	Reverse current prevention	VBC, VBD.
D24	Voltage regulator	VCO1.
D25,26	Reverse current prevention	Unlock signal.
D27	Voltage regulator	VCO0.
D28,29	NB detection	NB2.
D30	NB detection	NB1.
D33	Reverse current prevention	
D34	Reverse current prevention	FMC.

### PLL UNIT (X50-3170-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	AVR	8V (For PLL CAR unit).
IC2	Divider (1/2, 1/5)	1,14 : 20MHz input. 11 : 4MHz output. 12 : 10MHz output.
IC3	DDS	450~950kHz.
IC4	DDS	790.76~1290.76kHz.
IC5	PLL	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 11 : 97.152MHz input.
IC6	Divider (1/100)	4 : 97.152MHz input. 8 : 971.52kHz output.
IC7	Mixer	1 : 20.97152MHz output. 2 : 971.52kHz input. 5 : 20MHz input.
IC8	Mixer	1 : 13.695~13.195MHz output. 2 : 9.695~9.195MHz input. 5 : 4MHz input.
IC9	Mixer	1 : 4.95~4.45MHz output. 2 : 4MHz input. 5 : 950~450kHz input.
IC10	Mixer	1 : 35.05~35.55MHz output. 2 : 4.95~4.45MHz input. 5 : 40MHz input.
IC11	PLL	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 13 : 3.0~33.0MHz input.
IC12	Mixer	1 : 3.0~33.0MHz output. 2 : 37.055~37.555MHz input. 5 : 40.065~70.055MHz input.
IC13	Mixer	1 : 37.055~37.555MHz output. 2 : 13.695~13.195MHz input. 5 : 50.750MHz input.
Q1	Reference input buffer	20MHz.
Q2,3	Switching	Unlock detection.
Q4	Switching	VCO select (21.5~30MHz : on).

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q5	Switching	VCO select (14.5~21.5MHz : on).
Q6	Switching	VCO select (7.5~14.5MHz : on).
Q7	Switching	VCO select (10kHz~7.5MHz : on).
Q8	Buffer	D/A buffer.
Q9	Amplifier	DDS clock (20.97152MHz).
Q10	Buffer	20MHz.
Q11	Buffer	D/A buffer.
Q12,13	Switching	Chopper.
Q14	Buffer	Chopper output buffer.
Q15	Buffer	4MHz.
Q16	Buffer	LO output (35.05~35.55MHz).
Q17	Doubler	20MHz x 2 = 40MHz.
Q18~20	Amplifier	Active LPF (7.5~30MHz).
Q21~23	Amplifier	Active LPF (10kHz~7.5MHz).
Q24	Buffer	PLL IC input (3.0~33.0MHz).
Q25	Amplifier	PLL IC Input (3.0~33.0MHz).
Q26	Buffer	Sub VCO output (40.065~70.055MHz).
Q27	Buffer	40.065~70.055MHz.
Q28	Buffer	50.750MHz.
Q29	Buffer	Sub VCO output (40.065~70.055MHz).
Q30	Crystal oscillator	50.750MHz.
Q31	Buffer	50.750MHz.
Q32	Buffer	50.750MHz H507 output.
D1	Reverse current prevention	Unlock signal.
D2	Variable capacitor	VCO (97.152MHz).
D3	reverse current prevention	Unlock signal.
D4	Zener diode	Voltage regulator (12V).
D5	Zener diode	Voltage regulator (9V).

### CAR UNIT (X50-3180-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	PLL5 (Main LO4)	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 11 : 35.5MHz input.
IC2	Divider (1/100)	4 : 35.5MHz input. 8 : 355kHz output.
IC3	PLL6 (Main LO3)	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 11 : 162.5MHz input.
IC4	Divider (1/100)	4 : 162.5MHz input. 8 : 1.625MHz output.
IC5	Mixer (MIX7)	1 : 8.375MHz output. 2 : 1.625MHz input. 5 : 10MHz input.
IC6	PLL4 (Main and sub CAR)	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 11 : 69.5MHz input.
IC7	Divider (1/100)	4 : 69.5MHz input. 8 : 695kHz output.
IC8	Mixer (MIX13)	1 : 10.695MHz output. 2 : 695kHz input. 5 : 10MHz input.
IC9	PLL9 (Main CAR)	2,3,4 : Divided ratio setting input. 5 : 10MHz input. 7 : Lock voltage output. 8 : Unlock output, when unlocked "H". 11 : 9.85~13.5MHz input.
IC11	Mixer (MIX8)	When CW PITCH 800Hz
IC13	PLL (EXT STD)	1 : 80kHz output. 2 : 9.92MHz input. 5 : 10MHz input.
IC14	Divider (1/2, 1/5)	9 : 1MHz input. 13 : Lock voltage output. 14 : 10kHz input.
IC15	Divider (1/2)	1 : 10MHz output. 11 : 2MHz output. 12 : 10MHz input. 14 : 20MHz input.
Q1	Main LO4 output buffer	1 : 1MHz output. 3 : 2MHz input.
Q2	MIX7 input buffer	355kHz. 10MHz.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q3	Main LO3 output amplifier	8.375MHz.
Q4	MIX13 input buffer	10MHz.
Q5	Sub CAR output amplifier	10.695MHz.
Q8	MIX8 input buffer	9.92MHz when CW PITCH 800Hz.
Q9	MIX8 input buffer	10MHz.
Q10	AFT output buffer	30~130kHz in CW mode.
Q11	Main CAR output buffer	100kHz.
Q12	EXT STD buffer	10kHz.
Q13	OSC1	20MHz (STD).
Q14	OSC1 buffer	SO-2 buffer when SO-2 operates.
Q15	TTL input amplifier	20MHz.
Q16	REF output amplifier	20MHz (PLL unit).
Q17	REF output amplifier	10MHz (AF unit).
Q18	REF output amplifier	10MHz (DSP unit).
D1	Reverse current prevention	Unlock signal.
D2	VCO5 frequency adjustable	
D3	Reverse current prevention	Unlock signal.
D4	VCO6 frequency adjustable	
D5	Reverse current prevention	Unlock signal.
D6	VCO4 frequency adjustable	
D7	Reverse current prevention	Unlock signal.
D8	VCO9 frequency adjustable	
D9	VCXO frequency adjustable	OSC1.
D10	Voltage regulator	OSC1.
D14	Reverse current prevention	
D15	Voltage shift	5V power supply for SO-2.

### FILTER UNIT (X51-306X-XX) 0-12 : K,M,E,E3,X,P,T 2-71 : E2

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	Band data decoder	
IC2	Relay driver	
IC3	AVR	+5V.
Q1	relay driver	10F relay.
D1	Relay surge absorption	1.6~2.5MHz LPF relay.
D2	Relay surge absorption	2.5~4.0MHz LPF relay.
D3	Relay surge absorption	4.0~7.5MHz LPF relay.
D4	Relay surge absorption	7.5~10.5MHz LPF relay.
D5	Relay surge absorption	10.5~14.5MHz LPF relay.
D6	Relay surge absorption	14.5~21.5MHz LPF relay.
D7	Relay surge absorption	21.5~30.0MHz LPF relay.
D8	RF rectifier	REF rectifier.
D9	RF rectifier	FWD rectifier.
D10	Relay surge absorption	Transmit/receive select relay.
D11	LPF select	18, 21MHz.
D12	LPF select	25, 28MHz.
D13,14	Level shift	12V relay drive.
D15	Lightning surge protection	RAT terminal surge absorber.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

### CONTROL UNIT (X53-3380-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	Operation amplifier	1-2-3 : Power meter.
IC2	3 terminal AVR	Input : 15V. Output : 8V.
IC3	Operation amplifier	1-2-3 : ALC meter. 5-6-7 : lc meter.
IC4	Operation amplifier	Main audio amplifier.
IC5	Operation amplifier	1-2-3 : Sub audio amplifier.
IC6	Operation amplifier	Sub audio amplifier.
IC7	Analog switch	ALC/lc and PWR/main S meter select.
IC8	Analog switch	Speaker separate select.
IC9	One shot multi vibrator	2-3-4-5-7 : CKY timing. 10-11-12-13-14-16 : Semi break-in timing.
IC10	NAND gate	1-2-3 : CKY. 4-5-6 : RBC.
IC11	Inverter	8-9, 10-11, 12-13 : CKY.
IC12	Analog switch	1-2-13, 3-4-5 : CKY.
IC13	Inverter	1-2, 5-6 : Semi. 3-4 : Full. 12-13 : VOX. 8-9, 10-11 : Pulse delay.
IC14	NAND gate	1-2-3 : CKY. 8-9-10 : Semi. 11-12-13 : Full.
IC15	Inverter	1-2, 3-4, 8-9, 10-11 : Pulse delay.
IC16	Analog switch	1-2-3 : Full. 3-4-5 : Semi. 6-8-9, 10-11-12 : VOX.
Q1,2	Differential amplifier	ALC.
Q3	Switching	Power down.
Q4-7	Switching	AT tune.
Q8	Amplifier	ALC.
Q9	Amplifier	SWR protection.
Q10	Amplifier	IC protection.
Q11	Voltage shift	ALC meter voltage.
Q12	Buffer	ALC voltage control.
Q13	Switching	ALC/lc meter select.
Q14,15	Switching	Main and sub audio mute.
Q16,17	Switching	Relay select.
Q18,19	Switching	CKY delay select.
Q20	Switching	Discharge.
Q21,22	Switching	CKY delay select.
Q23	Switching	TXB delay select.
Q24	Switching	Stand-by control.
Q25	Switching	VOX.
Q26	Switching	CKY select in CW mode.
Q27	Muting	Sub audio mute.
Q28	Switching	CKY delay select.
D1	Switching	Temperature power down.
D2	Switching	28MHz and 50W power down.
D3	Switching	AT.
D4,5	Voltage shift	External ALC.
D6	Reference voltage	4.7V.
D7	Voltage shift	4.7V
D8	Voltage shift	
D9	Reverse current prevention	
D10	Over load prevention	Maximum 4.7V.
D11	Switching	TXB, separate.
D12,13	Voltage shift	
D14	Reference voltage	15V.
D15,16	Surge voltage absorption	
D17-19	Reverse current prevention	
D20	Switching	KEY, ATS.
D21-24	Switching	CKY.
D25	Switching	Discharge.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
D26,27	Switching	CTXB.
D28	Reverse current prevention	
D29~33	Switching	SS.
D34	Switching	SS, ATS.
D35	Switching	D15, CKY.
D36	Switching	Discharge.
D37	Reference voltage	5.1V.
D38	Switching	Sub mute.
D39,40	Over load prevention	Maximum 4.7V.
D41,43	Switching	Discharge.
D42	Reverse current prevention	
D44,45	Switching	SSB.
D46	Over load prevention	Maximum 4.7V.

### DSP UNIT (X53-3390-00)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	Power supply	+5V.
IC2	Power supply	-5V.
IC3	Switching	Resistor select of HPF 1st stage.
IC4	Switching	Resistor select of HPF 2nd stage.
IC5	Operation amplifier	MIC amplifier, HPF 1st stage.
IC6	Operation amplifier	HPF 2nd stage, RIF amplifier.
IC7	Switching	A/D converter input select.
IC8	LPF	Limiter amplifier, 5th LPF (AAF).
IC9	Operation amplifier	Limiter amplifier clipper.
IC10,11	Operation amplifier	S/H amplifier.
IC12	A/D converter	16 bit.
IC13	Divider	0 input limit cycle suppression.
IC14	Gate	Buffer.
IC15	Latch	Timing adjust.
IC16	D/A converter	16 bit.
IC17	Switching	D/A output chopper.
IC18	Operation amplifier	D/A buffer.
IC19	LPF	5th LPF (SMF).
IC20	Switching	Mixer, detector output on/off.
IC21	DSP	Signal processor.
IC22	Gate array	Timing, DSP and analog interface.
IC23	Gate	Timing adjustment from DSP to gate array.
IC24	Power supply voltage detect	DSP unit power on reset.
IC25	Power supply	+5V local regulator for PLL IC.
IC26	PLL	
Q1	Switching	S/H.
Q2	Buffer	Mixer.
Q3	Amplifier	Modulator output.
Q5	Buffer	Modulator output.
Q6	Switching	TXB level conversion.
Q7	Switching	RTK level conversion.
Q8	Amplifier	Level conversion to gate array.
Q9	amplifier	PLL reference amplifier.
Q10	Buffer	PLL active filter.
Q11,12	Amplifier	PLL active filter.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q13	OSC	VCO.
Q14	Buffer	VCO buffer.
Q15	Buffer	Buffer to digital section.
D1	Zener diode	level shift.
D2	Switching	Limiter amplifier.
D3	Switching	Input protection.
D4	Variable capacitor	VCO.

### DISPLAY UNIT (X54-3080-01)

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	Display sub CPU	FL tube, LED, sub-tone and BZ mixer.
IC2,3	Display gate array	FL tube control port output.
IC4	Address decoder	Each IC chip select.
IC5	Function LED latch	
IC6	Sub-tone output latch	Sub-tone D/A converter output.
IC7	Inverter	Logic inverted.
IC8	Sub-tone control, reset control	
IC9	Output latch	BZ and option VS-2 data output.
IC10	Oscillator gate	BZ and 1750Hz tone oscillator.
Q1-137	FL tube starter driver	FL tube starter voltage driver from TTL level.
D1	FL tune heater bias voltage	Between F and F : Approx. AC 9.6V.      Between FG and G : Approx. DC -28V.

### SIGNAL UNIT (X57-4130-00)

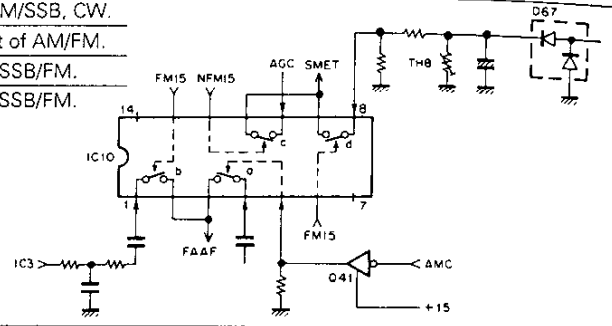

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1 (a/4)	AGC select switch	SSB, CW and AM mode select.
IC1 (b/4)	AGC select switch	AGC time constant (MID).
IC1 (c/4)	AGC select switch	AGC time constant (SLOW).
IC1 (d/4)		Unused.
IC2 (a/2)	CAR squelch amplifier	
IC2 (b/2)	FM squelch amplifier	
IC3	FM pre-amplifier	
IC4 (a/4)		Unused.
IC4 (b/4)	Select switch	
IC4 (c/4)	Select switch	
IC4 (d/4)		Unused.
IC5	Transmitter IF amplifier	455kHz.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC6,7	Receive FM IF amplifier	2 : Input. 5 : Output.
IC8	I/O interface	2~11 : I/O. 12 : SO input. 13 : SI input. 14 : CK input.
IC10 (a/4)	Select switch	AGC select of AM/SSB, CW.
IC10 (b/4)	Select switch	AF output select of AM/FM.
IC10 (c/4)	Select switch	Meter select of SSB/FM.
IC10 (d/4)	Select switch	Meter select of SSB/FM.
Q1,2	Receive IF amplifier	455kHz.
Q3	Receive 4th mixer	455kHz → 100kHz.
Q4	IF amplifier	100kHz.
Q5	Switching	RBC signal.
Q6	Buffer	AF.
Q7	Local frequency amplifier	355kHz.
Q8	CAR buffer	100kHz.
Q9	AGC buffer	
Q10~13	AGC amplifier	
Q19,20	FM noise amplifier	
Q22	CAR squelch amplifier	
Q25,27	Transmitter IF buffer	455kHz.
Q28	Receive FM IF amplifier	455kHz.
Q29	FM AF AGC amplifier	
Q30,33	Processor amplifier	455kHz.
Q34	FM S-meter amplifier	455kHz.
Q35,36	Switching	
Q37	Switching	NFM15.
Q38	Switching	FM15.
Q39	Switching	
Q41	Switching	AM15.
Q42,43	Switching	
Q48	Switching	DFM.
Q49	Switching	DCAR.
Q50	Switching	

# TS-950SDX

## DESCRIPTION OF COMPONENTS

## DESCRIPTION OF COMPONENTS

Ref. No.	Use/Function	Operation/Condition/Compatibility
D61,62,64	Switching	455kHz.
D65	Limiter	Compression meter.
D66	Rectifier	Compression meter.
D67	Rectifier	FM S-meter.
D68,69	Reverse current prevention	
D70	Reverse current prevention	ATS.
D71	Voltage regulator	9V.
D74	Temperature compensation	RFG.

### VCO2 (X58-3390-03) : AF UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1	VCO0 (PLL0)	64.22MHz.
Q2	VCO0 buffer	
D1	VCO0 frequency adjustable	

### VCO (X58-3630-00) : AF UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1	VCO1-A (PLL1)	73.06~80.55MHz.
Q2	VCO1-B (PLL1)	80.55~87.55MHz.
Q3	VCO1-C (PLL1)	87.55~94.55MHz.
Q4	VCO1-D (PLL1)	94.55~103.05MHz.
D1	VCO1-A frequency adjustable	
D2	VCO1 switching	On when VAC is "L".
D3	VCO1-B frequency adjustable	
D4	VCO1 switching	On when VBC is "L".
D5	VCO1-C frequency adjustable	
D6	VCO1 switching	On when VCC is "L".
D7	VCO1-D frequency adjustable	
D8	VCO1 switching	On when VDC is "L".

### VCO (X58-3630-01) : PLL UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1	VCO7-D (PLL7)	61.055~70.055MHz.
Q2	VCO7-C (PLL7)	54.055~62.055MHz.
Q3	VCO7-B (PLL7)	47.055~55.055MHz.
Q4	VCO7-A (PLL7)	40.065~48.055MHz.
D1	VCO7-D frequency adjustable	
D2	VCO7 switching	On when VAC is "L".
D3	VCO7-C frequency adjustable	
D4	VCO7 switching	On when VBC is "L".
D5	VCO7-B frequency adjustable	
D6	VCO7 switching	On when VCC is "L".
D7	VCO7-A frequency adjustable	
D8	VCO7 switching	On when VDC is "L".

## DESCRIPTION OF COMPONENTS

### VOX (X59-1080-01) : AF UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1 (1/2)	VOX level comparator	
IC1 (2/2)	ANTI VOX level comparator	
IC2	NOR circuit	
Q1	Switching	On when 11 pin of IC2 is "H".
D1,2	Reverse current prevention	

### FM MIC AMP (X59-3000-03) : AF UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1 (1/2)	Low-pass filter	1,2 : Output.
IC1 (2/2)	Limiting amplifier	6 : Input. 7 : Output.

### NB2 (X59-3350-00) : IF, AF UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1	One shot multi-vibrator	Synchronized with pulse 5ms or 40ms.
Q1,2	Switching	Q1 turned on with 5ms when pulse occurs and Q2 turned off with 40ms.

### VCO1 (X59-3440-00) : PLL, CAR UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1	VCO	30~110MHz.
Q2	VCO buffer	

### LPF (X59-3450-XX) -00 : AF UNIT -01 : PLL, CAR UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1~3	PLL low-pass filter	Active filter.

### MKR (X59-3640-00) : CAR UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC1 (1/2)	Divider (1/2)	
IC1 (2/2)	Divider (1/2)	
D1	Switching	On when CALS is "L".
D2	Reverse current prevention	

### CWT (X59-3660-00) : CONTROL UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q201	Switching	Keying signal.
Q202	Switching	Transmitter voltage supply.
Q203~205	Switching	Transmitter stop signal.
Q206~208	Switching	Keying switch.
D201,202	Reverse current prevention	
D203	Reference voltage	3.6V.
D204	Reference voltage	4.7V.

# TS-950SDX

## DESCRIPTION OF COMPONENTS

### MAP (X59-3670-00) : CONTROL UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
IC301	Meter amplifier	1-2-3 : SWR meter. 5-6-7 : Processor meter.

### TRX (X59-3680-00) : CONTROL UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q151	Switching	Receive voltage supply.
Q152	Switching	Transmitter voltage supply.
Q153	Switching	Transmitter.
Q154,155	Switching	Receive.

### ALC (X59-3700-00) : CONTROL UNIT

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q251	Switching	CKY and DSP.
Q252,253	Switching	Stand-by switch control.
Q254	Switching	AT switch.
Q255	Switching	Personal computer interface.
D251	Reverse current prevention	
D252	Reference voltage	12V.

### MIC AMP (X59-3710-01) : SWITCH UNIT (A)

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q251	MIC amplifier	Amplified input signal from MIC.
Q252	Packet communication switch	Muted to MIC amplifier when using a packet communication.
Q253	Data switch	Muted to MIC amplifier when using a data communication.
Q254	MIC amplifier switch	Muted to MIC amplifier.
Q255	Packet communication stand-by switch	Transmitter signal to supply when using a packet communication.
D251	Reverse current prevention

### • Terminal description

Pin No.	Symbol	Description
1	VBB	Board terminal (connection a 0.01 $\mu$ F capacitor between GND).
2	CLK	Clock input for 20-bit series data input (shifted by rise).
3	LAT	Latch signal input terminal for shift register input data (latched by rise) and up/down clock input terminal (Changes the state at rise).
4	DIN	Data input terminal and up/down mode select terminal (up mode for "H" level, down mode for "L" level).
5	XI	Reference signal generating oscillator connecting terminal (max. 13MHz, standard 4.0MHz).
6	XO	
7	PD	Phase comparator output terminal (3 states).
8	AO	External control signal output terminal/unlock output terminal (E/E MOS push-pull).
9	BO	External control signal output/data check terminal (E/E MOS push-pull).
10	TVI	RF signal input terminal (300MHz or 350MHz max.). 1/2 prescaler incorporated.
11	FMI	RF signal input terminal (150MHz or 180MHz max.)
12	VDD	Power supply (+5V).
13	AMI	RF signal input terminal (40MHz or 50MHz max.).
14	VSS	GND terminal.

## SEMICONDUCTOR DATA

I/O Port : MB89363B (Digital unit IC3, IC6, IC7)

• Block diagram

## SEMICONDUCTOR DATA

### • Terminal function

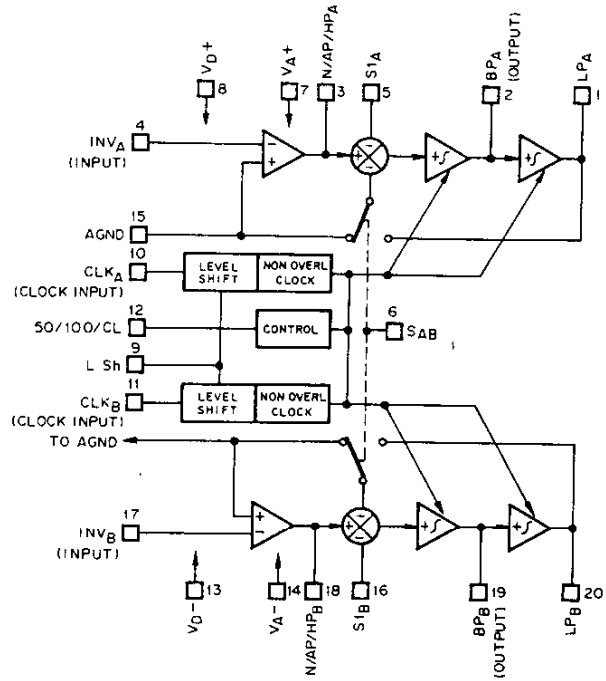

Pin No.	Pin name	Name	I/O	Function
1~4 77~80	P30~P37	Port 3 all bits	I/O	Eight-bit general-purpose input/output port. These terminals are included in group 2. Three operation modes can be selected by setting the control parameter by software.
5	W	Write	I	The control parameter and port output data item can be written using a low-level signal. The parameter and port data can be distinguished and selected using the CS1, CS2, RSLCT0, and RSLCT1 signals.
6	RST	Initial setting reset	I	Input terminal. The MB89363B is set to the initial mode using a reset signal, and initial value 9B (hexadecimal) is automatically set for two control parameters. The initial mode indicates that all ports are in the input state of mode 0. All port terminals stay high in the initial mode. The active signal level is selected using an RH/RL signal. RH/RL = 0 : RST (active low)      RH/RL = 1 : RST (active high)
9	RH/RL	Reset active level selection	I	The RST terminal is set to active high or active low. RH/RL = 0 : RST (active low)      RH/RL = 1 : RST (active high) The RH/RL terminal is fixed at either Vcc or GND at all times.
11	OUS/INS	Port 0 and 3 read value selection	I	This terminal indicates the output state of ports 0 and 3. It also selects whether the external terminal value of ports 0 and 3 is read directly or whether the output latch value of ports 0 and 3 is read directly when reading the value of ports 0 and 3. OUS/INS = 0 : The output latch value of ports 0 and 3 is read. OUS/INS = 1 : The external terminal value of ports 0 and 3 is read.
12~19	DB0~DB7	Bidirectional data bus	I/O	Eight-bit, bidirectional data bus. These terminals are used for data communication with the MPU. The bus signal making and breaking and data direction are controlled using the CS1, CS2, R and W signals.
20~23 25~28	P00~P07	Port 0 all bits	I/O	Eight-bit, general-purpose input/output port. These terminals are included in group 0. Three operation modes can be selected by setting the control parameter by software.
29 75	CS1 CS2	Device selection	I	When a low-level signal is input to this terminal, signals DB0 through DB7 are released and data communication with the MPU takes place. At that time, the control parameter is written, and data is written into or read from each port. CS1 = 0 : I/O1 CS2 = 0 : I/O2 Simultaneous selection of CS1 = 0 and CS2 = 0 is inhibited.
30, 74	GND	Ground terminal	I	0V.
31 32	RSLCT0 RSLCT1	Access selection	I	When data is sent to the MPU, the parameter and port are distinguished and selected using the CS1, CS2, RSLCT0, and RSLCT1 signals.
34~40 43	P20~P27	Port 2 all bits	I/O	These terminals are used as a general-purpose input/output port, handshaking control terminals, and status data bit input/output terminals in accordance with the operation functions and modes of groups 0 and 1.
44~51	P10~P17	Port 1 all bits	I/O	Eight-bit, general-purpose input/output port. These terminals are included in group 1. Two operation modes can be selected by setting the control parameter by software.
53	Vcc			+5V power.
54~61	P40~P47	Port 4 all bits	I/O	Eight-bit, general-purpose input/output port. These terminals are included in group 3. Two operation modes can be selected by setting the control parameter by software.
62 65~71	P50~P57	Port 5 all bits	I/O	These terminals are used as a general-purpose input/output port, handshaking control terminals, and status data bit input/output terminals.
76	R	Read	I	Data from each port is read using a low-level signal. The port type is selected using the CS1, CS2, RSLCT0, and RSLCT1 signals.
7,8,10,24 33,41,42 52,63,64 72,73	NC	-	-	Connection to the NC terminal is inhibited.

## SEMICONDUCTOR DATA

### Switched Capacitor Filter : MF10CCWM (AF unit IC2)

- **Features**
- The cut-off frequency stability varies depending on the external clock.
- The cut-off and center frequencies of a filter can be set and altered using the external clock frequency.
- 20-pin DIP package.
- SO package is provided for surface installation.
- Clock and center frequencies have a high precision ratio ( $f_{CLK}/f_0$ ). ( $\pm 0.6\%$  : MF10AC,  $\pm 1.5\%$  : MF10C)
- Three independent low-pass, bandpass, and high-pass (or notch or all-pass) outputs.
- The product of center frequency  $f_0$  and  $Q$  ( $f_0 \times Q$ ) is 200kHz.
- Input frequency is 20kHz (representative value is 30kHz).

• Block diagram

• Terminal function

Pin No.	Pin name	I/O	Function
1	ANALOG INPUT	I	A/D converter analog input. Input impedance 1.5kΩ (TYP).
2	-Vcc	-	Analog -Vcc.
3	MSB ADJ	I	MSB adjustment (MSB DLE compensation) input terminal.
4	+VDD	-	Comparator +VDD.
5	NC	-	
6	COMP GND	-	Comparator ground. Usually connected to digital common.
7	MSB	O	MSB output terminal.
8	BOB/BTC SELECT	I	Output digital code selection terminal. "L" : BOB, "H" : BTC
9	STATUS	O	Status signal output terminal.
10	CLOCK OUT	O	Main clock output terminal for SAR operation.
11	RC1	-	Internal clock oscillation frequency setting terminal. Pulled up to +VDD by 10kΩ when an external clock is used.
12	RC2	-	Internal clock oscillation frequency setting terminal. Pulled up to +VDD by 10kΩ when an external clock is used.
13	SERIAL OUT2	O	Serial data output synchronized with EXT CLOCK2 signal.
14	+VDD	-	Digital +VDD.
15	SERIAL OUT1	O	Serial data output synchronized with internal clock or EXT CLOCK1.
16	EXT CLOCK1	I	External clock (EXT CLOCK1) input. Opened or pulled up when not used.
17	INT/EXT SELECT	I	Internal/external clock selection terminal. "L" : INT, "H" : EXT
18	SHORT CYCLE	I	Short cycle timing input terminal.
19	CONV CMD	I	Conversion command signal input terminal. Set low when not used.
20	WORD CLOCK	I	WORD CLOCK input terminal. Opened or pulled up when not used.
21	EXT CLOCK2	I	External clock (EXT CLOCK2) input terminal. Opened or pulled up when not used.
22	DIGITAL GND	-	Digital ground.
23	+Vcc	-	Analog +Vcc.
24	V POT	O	MSB adjustment reference voltage output terminal.
25	FILTER2	-	Internal reference filter. A 3.3μF capacitor is connected to -Vcc.
26	ANALOG GND	-	Analog ground. A 2.2μF capacitor is connected to ANA GND.
27	TP	-	Test point for operation check.
28	FILTER1	-	Internal reference filter. A 3.3μF capacitor is connected to ANA GND.

2nd word	A	B	C	D	E	F	G	H	J	K	V
0	1.0	1.25	1.6	2.0	2.5	3.15	4.0	5.0	6.3	8.0	-
1	10	12.5	16	20	25	31.5	40	50	63	80	35
2	100	125	160	200	250	315	400	500	630	800	-
3	1000	1250	1600	2000	2500	3150	4000	5000	6300	8000	-

#### • Chip capacitors (Refer to the table above except dimension)

(EX) CC 73 E SL 1H 000 ↓  
1 2 3 4 5 6 7  
(Chip) (CH, RH, UJ, SL)

(EX) CK 73 E F 1H 000 Z  
1 2 3 4 5 6 7  
(Chip) (B, F)

#### Dimension

#### • Dimension (Chip capacitor)

Dimension code	L	W	T
Empty	5.6 ± 0.5	5.0 ± 0.5	Less than 2.0
E	3.2 ± 0.2	1.6 ± 0.2	Less than 1.25
F	2.0 ± 0.3	1.25 ± 0.2	Less than 1.25

#### • Dimension (Chip resistor)

Dimension code	L	W	T	Wattage
E	3.2 ± 0.2	1.6 ± 0.2	0.57	2B
F	2.0 ± 0.3	1.25 ± 0.2	0.45	2A

#### Rating wattage

Code	Wattage	Code	Wattage	Code	Wattage
2A	1/10W	2E	1/4W	3A	1W
2B	1/8W	2H	1/2W	3D	2W
2C	1/6W				

### RESISTORS

#### • Chip resistor (Carbon)

(EX) RD 73 E B 2B 000 ↓  
1 2 3 4 5 6 7  
(Chip) (B, F)

#### • Carbon resistor (Normal type)

(EX) RD 14 B B 2C 000 ↓  
1 2 3 4 5 6 7

- 1 = Type ... ceramic, electrolytic, etc.    5 = Voltage rating  
2 = Shape ... round, square, ect.        6 = Value  
3 = Dimension                                7 = Tolerance  
4 = Temp. coefficient

## PACKING

## ADJUSTMENT

### Required Test Equipment

#### 1. DC Voltmeter (DC V.M)

- 1) Input resistance : More than  $1M\Omega$
- 2) Voltage range : 1.5 to 1000V AC/DC

**Note** : A high-precision multimeter may be used. However, accurate readings can not be obtained for high-impedance circuits.

#### 2. DC Ammeter

- 1) Current range : 100mA, 1.5A, 15A, High-precision ammeter may be used.

#### 3. RF VTVM (RF V.M)

- 1) Input impedance :  $1M\Omega$  and less than 3pF, min.
- 2) Voltage range : 10mV to 300V
- 3) Frequency range : 10kHz to 500MHz

#### 4. AF Voltmeter (AF V.M)

- 1) Frequency range : 50Hz to 10kHz
- 2) Input resistance :  $1M\Omega$  or greater
- 3) Voltage range : 10mV to 30V

#### 5. AF Generator (AG)

- 1) Frequency range : 200Hz to 5kHz
- 2) Output : 1mV or less to 1V, low distortion

#### 6. AF Dummy Load

- 1) Impedance :  $8\Omega$
- 2) Dissipation : 3W or greater

#### 7. Oscilloscope

Requires high sensitivity, and external synchronization capability (150MHz or greater).

#### 8. Sweep Generator

- 1) Center frequency : 50kHz to 90MHz
- 2) Frequency deviation : Maximum  $\pm 35$ MHz
- 3) Output voltage : 0.1V or greater
- 4) Sweep rate : At least 0.5 sec/cm

#### 9. Standard Signal Generator (SSG)

- 1) Frequency range : 50kHz to 50MHz
- 2) Output :  $-20$ dB/0.1 $\mu$ V to 120dB/1V
- 3) Output impedance :  $50\Omega$
- 4) AM and FM modulation can be possible.

**Note** : Generator must be frequency stable.

#### 10. Frequency Counter (f. counter)

- 1) Minimum input voltage : 50mV
- 2) Frequency range : 150MHz or greater

#### 11. Noise Generator

Must generate ignition noise containing harmonics beyond 30MHz

#### 12. RF Dummy Load

- 1) Impedance :  $150\Omega$  and  $50\Omega$
- 2) Dissipation : 150W or greater

#### 13. Linear Detector

- 1) Frequency range : 30MHz

#### 14. Power Meter

- 1) Impedance :  $50\Omega$
- 2) Dissipation : 300W continuous or greater
- 3) Frequency limits : 60MHz or greater

#### 15. Spectrum Analyzer

- 1) Frequency range : 100kHz to 110MHz or greater
- 2) Bandwidth : 1kHz to 3MHz

#### 16. Detector

- 1) For adjustment of TX BPF

- 2) For adjustment of PLLVCO BPF

#### 17. Directional Coupler

#### 18. Monitor Receiver

R-1000 class

#### 19. Microphone

MC-43S or MC-60/60S8

#### 20. Tracking Generator

# TS-950SDX

## ADJUSTMENT

### Preparation

#### • Setting

There should not comes out easily.

Push knob are all OFF.

Unless otherwise specified, set the controls as follows;

## ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks							
		Test-equipment	Unit	Terminal	Unit	Parts	Method								
1. Operation description	1) Setting of adjustment mode	The MENU No. display will be set to the adjustment mode when the power is turned on while pressing 3 and 9 keys. Display M. CH.													
	2) Selection of adjustment mode MENU No.	The MENU No. can be changed by turning M. CH/VFO CH.													
	3) Frequency setting in adjustment mode	The frequency can be changed by pressing M. CH and entering the memory CH with number keys. [ENT] + Frequency + [ENT]													
	4) Exiting adjustment mode	Pressing CLR returns to the display to the normal memory CH display.													
	5) Normal frequency setting	The memory CH (frequency) can be changed by turning M. CH/VFO CH.													
	6) Expression of frequency and mode setting. ** : Memory CH	<ul style="list-style-type: none"> <li>Adjustment mode Expressed in the form of "M. CH** pressing M. CH".</li> <li>Normal Expression in the form of "M. CH".</li> </ul>													
	7) Interruption of adjustment mode	In the case of turning off the power when in the adjustment mode, the power is to be turned off while pressing CLR. Pressing CLR causes data to be into ROM.													
2. Memory frequency table  Note : These frequencies will be written when the power is turned on while pressing 1 and 7 keys.	M. CH	Frequency	Mode	M. CH	Frequency	Mode	M. CH	Frequency	Mode	M. CH	Frequency	Mode	M. CH	Frequency	Mode

	3	-12SG	Signal unit -12V output.
CN5 (A/6)	1	TPT	Approx. 5V output when power down.
	2	GND	GND.
	3	AF15	Control unit +15V output. (For AF amplifier $\mu$ PC2002)
	4	15CN	Control unit +15V output.
	5	-12CN	Control unit -12V output.
CN6 (A/6)	1	5PL	PLL unit +5V output.
	2	15PL	PLL unit +15V output.
	3	GND	GND.
	4	5DG	Digital unit +5V output.
	5	GND	GND.
	6	5DS	Display unit +5V output.
	7	15DS	Display unit +15V output.
	8	GND	GND.
CN7 (D/6)	1	F	Display unit heater voltage input. (Between F to FG : AC 4.9V)
	2	FG	Display unit heater GND.
	3	F	Display unit heater voltage input. (Between F to FG : AC 4.9V)
CN8 (A/6)	1	5DM	DSP unit +5V output.
	2	5GND	GND.
	3	15DM	DSP unit +15V output.
	4	15GND	GND.
	5	-12DM	DSP unit -12V output.
	6	NC	Not used.
CN9 (C/6)	1	FG1	Final unit GND.
	2	FG1	Final unit GND.
	3	FHV	Final unit +68V output.
	4	FHV	Final unit +68V output.
CN10 (A/6)	1	GND	GND.
	2	GND	GND.
	3	CO	+15V power supply input.
	4	CO	+15V power supply input.
CN11 (B/6)	1	HV	Display unit -40V output.
	2	HG	GND.
	3	NC	Not used.
CN12 (B/6)	1	GND	GND.
	2	-12	Each unit -12V output.
CN13 (B/6)	1	AC40	-40V power supply input.
	2	AC40	-40V power supply input.
	3	AC12	-12V power supply input.
	4	AC12	-12V power supply input.
CN14 (D/6)	1	F	Display unit heater voltage output. (Between F to FG : AC 4.9V)
	2	FG	Display unit heater GND.
	3	F	Display unit heater voltage output. (Between F to FG : AC 4.9V)

## TERMINAL FUNCTION

Connector No.	Terminal No.	Terminal Name	Terminal Function
CN15 (D/6)	1	BB	+15V power supply bias output.
CN16 (A/6)	1	SCRA	SCR input.
W1 (A/6)	1	GND	GND.
	2	-12	Each unit -12V input.
W2 (C/6)		GND	GND.
		GND	GND.
		CO	+15V power supply output.
		CO	+15V power supply output.
W3 (A/6)		BB	+15V power supply bias input.
W4 (A/6, E/6)	1	S1	Heat sink thermal switch +.
	2	S2	Heat sink thermal switch -.
W101 (F/6)		SCRA	SCR output.
(B/6)		AC-L	AC live (AC hot side).
		AC-N	AC neutral (AC GND side).
		PWR-C	Power switch common.
		PWR-M	Power switch make.
		T-L	Power transformer live.
		T-N	Power transformer neutral.
<b>RF UNIT (X44-3140-00)</b>			
CN1		TIF	TX IF signal (73.05MHz).
CN2	1	MKR	Marker signal.
	2	GND	Marker signal GND.
CN3		MVCO	Main LO1 input (73.06~103.05MHz).
CN4		SVCO	Sub LO1 input (40.065~70.055MHz).
CN6	1	HIPC	AIP control signal.
	2	RB0	RX band data.
	3	RB1	RX band data.
	4	RB2	RX band data.
	5	RB3	RX band data.
	6	NC	Not used.
CN7		MIF	Main IF signal (73.05MHz).
CN8	1/2	RANT	RX antenna input.
	2/2	DRV	TX drive output.
CN9	1	ATT1	RX attenuator signal. "H" : 10dB
	2	ATT2	RX attenuator signal. "L" : 20dB
	3	+15	+15V.
	4	PCV	Power control gain variable voltage.
CN10		SIF	Sub IF signal.
W4	1	GND	GND.
	2	MOS	+15V when monitor operation.
	3	ATS	+15V when AT TUNE operation.
	4	AGC	RF AGC control signal.
	5	TXB	TX +15V.
	6	+15	+15V.
	7	RXB	RX +15V.
W5	1	GND	GND.
	2	TF1	TX BPF select signal (0.01~7.5MHz).
	3	TF2	TX BPF select signal (7.5~24.5MHz).
	4	TF3	TX BPF select signal (14.5~30MHz).
<b>FINAL UNIT (X45-3450-00)</b>			
CN1	1	FG1	50V GND.
	2	FG1	50V GND.
	3	FHV	+50V.
	4	FHV	+50V.

Connector No.	Terminal No.	Terminal Name	Terminal Function

	6	RXB	RX +15V.
	7	+15	+15V.
CN13	1	AGC	AGC line.
	2	AGCA	Main AGC voltage.
	3	RXB	RX +15V.
	4	TXB	TX +15V.
	5	-12	-12V.
	6	+15	+15V.
	7	GND	GND.
	8	SMET	S-meter voltage output. <sup>1</sup>
CN14	1	NOTS	NOTCH switch.
	2	NFM15	+15V except FM mode.
	3	FSQ1	FM squelch volume 1.
	4	FSQ2	FM squelch volume 2.
	5	SQ2	Carrier squelch volume 2.
	6	NOTS	NOTCH switch.
	7	NOV2	NOTCH volume 2.
	8	SQ1	Carrier squelch volume 1.
	9	GND	GND.
CN15	1	IFO2	IF OUT2 output.
	2	GND	GND.
CN16	1	C100	100kHz carrier frequency input.
	2	GND	GND.
	3	C355	355kHz local frequency input.
	4	GND	GND.
CN17	1	TR455	TX/RX 455kHz input/output.
	2	GND	GND.
CN18	1	DB	DSP on signal.
	2	GND	GND.
	3	D455	455kHz input from DSP.
CN301	1	TXB	TX +15V.
	2	CKY	Keying control signal.
	3	NC	Not used.

## BLOCK DIAGRAM

### RX Section

Frequency : 14.200MHz  
 Input : 0dBμ  
 AF output : 0.63V/8Ω

### TX Section

# LEVEL DIAGRAM

Frequency : 14.200MHz  
 Input : 0dBμ  
 AF output : 0.63V/8Ω

1. The figures shown are signal generator output required for a constant audi. Set the AF gain control for 0.63V/8Ω audio output at 0dBμ signal generator
2. To measure signal generator output connect a 0.01μF capacitor between it (100kHz or less : 0.1μF capacitor)
3. AIP : OFF

Frequency : 14.200MHz

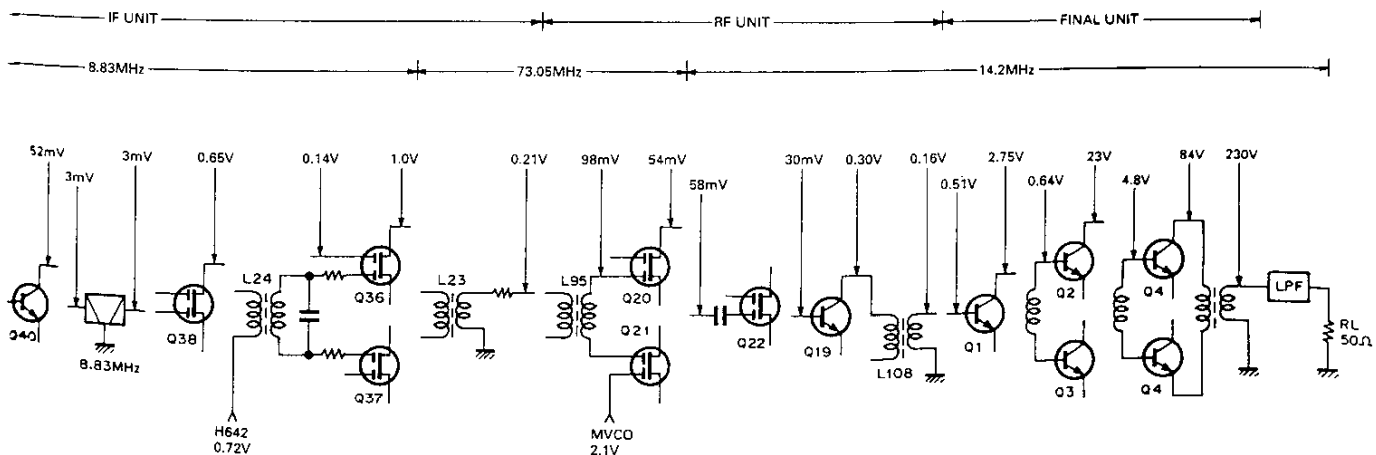

1. The high frequency section is measured by the RF voltmeter in the CW mode. The low frequency section is measured by the AF voltmeter in the USB mode.
2. The value of the audio input signal is obtained by the 1kHz/5mV single tone for the ALC zone of the meter in the USB mode or standard modulation (±3k).
3. When the value of the audio input signal is obtained by the 4kHz single tone for the ALC zone of the meter by PROC OUT VR, and also, adjust starting level.
4. The value of the final unit is measured by the oscilloscope in the CW mode.

# TS-950SDX

## DIAGRAM

1. The figures shown are signal generator output required for a constant audio output with a constant AF gain control setting. Set the AF gain control for 0.63V/8Ω audio output at 0dBμ signal generator input at 14.200MHz.
2. To measure signal generator output connect a 0.01μF capacitor between the signal generator and the check point. (100kHz or less : 0.1μF capacitor)
3. AIP : OFF

Frequency : 14.200MHz

1. The high frequency section is measured by the RF voltmeter in the CW mode. (In the dotted line : USB mode)  
The low frequency section is measured by the AF voltmeter in the USB mode.
2. The value of the audio input signal is obtained by the 1kHz/5mV single tone which measures almost full scale within the ALC zone of the meter in the USB mode or standard modulation (±3kHz, dev.) in the FM mode.
3. When the value of the audio input signal is obtained by the 4kHz single tone which adjusts almost full scale within the ALC zone of the meter by PROC OUT VR, and also, adjust starting level within the COMP zone of the meter by PROC IN VR.
4. The value of the final unit is measured by the oscilloscope in the CW mode.

## DRU-2 (DIGITAL RECORDING UNIT)

### DRU-2 Circuit Description

#### 1. Overview

The DRU-2 is an optional digital audio recording/playback unit for the TS-950SDX and TS-850 series. It has the following features.

- Record receive tone (main unit speaker output) and transmit tone (main unit microphone input)
- Play back via the speaker or output as transmit modulation signal
- Built-in lithium battery for backing up recorded data

#### 2. Operation

##### • Receive tone (main band)

The receive signal from the VO pin goes to pin 1 (0Y) of the multiplexer IC (TC4052BF). It goes to pin 59 (MIC IN) of IC3 (TC8830F) from pin 3 (Y). It is amplified by about 26dB by the microphone amplifier in IC3, output from from pin 60 (C1), fed to pin 63 (C2) again, and amplified by 20dB. This signal is output to pin 64 (MIC OUT) and input to pin 65 (ADI) to record the receive tone.

##### • Recording transmit tone (MIC input)

The MIC input from the VI pin is amplified by Q5 and goes to pin 2 (2Y) of the multiplexer, IC1 (TC4052BF). The signal is input to IC3 (TC8830F) from pin 3 (Y) and recorded in the same way as the receive tone.

##### • Playback from the internal speaker

The D/A converter output from pin 66 (DAO) of IC3 (TC8830F) passes through filter CR, is amplified by Q6, and goes to pin 13 (X) of the multiplexer IC1 (TC4052BF). It is output from pin 14 (1X) to the VO pin.

##### • Playback as transmit modulation signal

When a playback transmission operation is performed, the D/A converter output from pin 66 (DAO) of IC3 (TC8830F) passes through filter CR, is amplified by Q6, and goes to pin 13 (X) of the multiplexer, IC1 (TC4052BF) in the same way as for playback from the internal speaker. The signal is output from pin 11 (3X).

	VOA (pin 10)	VOB (pin 9)	ON channel
SP playback	H	L	1X (pin 14)
Transmission playback	H	H	3X (pin 11)
SP recording	L	L	0Y (pin1)
MIC recording	L	H	2Y (pin 2)

Table 1 IC1 (TC4052BF) operation

## SP-950 (EXTERNAL SPEAKER)

### SP-950 External View

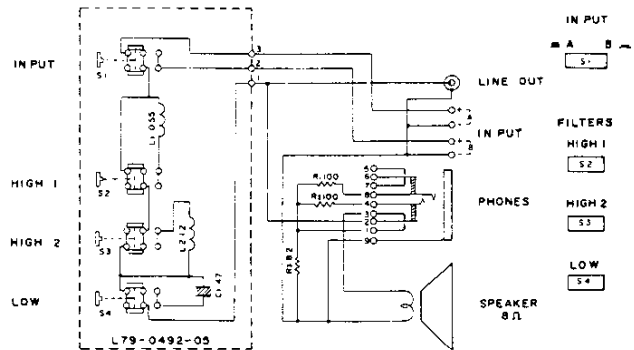

### SP-950 Specifications

Speaker used ..... 10 cm dia.  
 Rated input ..... 1 W  
 Impedance ..... 8  $\Omega$   
 Frequency response ..... 160 Hz to 7 kHz  
 Filter cut-off frequency  
     HIGH1 ..... 3.0 kHz/-3dB  
     HIGH2 ..... 1.2 kHz/-3dB  
     HIGH1, 2 ..... 900 Hz/-3dB  
     LOW ..... 400 Hz/-3dB  
 Filter attenuation ..... -6dB/oct.  
 Dimensions (W x H x D) ..... 180 x 141 x 310 (mm)  
 Weight ..... 2.0 kg

## OPTION FILTER

Item	Rating
Nominal center frequency	8830kHz
Center frequency deviation	Within $\pm 150\text{Hz}$ at 6dB
Passband width	$\pm 900\text{Hz}$ or more at 6dB
Attenuation bandwidth	$\pm 1800\text{Hz}$ or less at 60dB
Ripple	2dB or less
Insertion loss	Within 3dB $\pm$ 2dB
Guaranteed attenuation	80dB or more in the range $\pm 2.5\text{kHz}$ to $\pm 1\text{MHz}$
Input and output impedance	600 $\Omega$ /15pF

**SSB Crystal filter (L71-0406-05) : YK-88SN-1**

Item	Rating
Nominal center frequency	455kHz
Center frequency deviation	Within $\pm 50\text{Hz}$ at 6dB
Passband width	$\pm 125\text{Hz}$ or more at 6dB
Attenuation bandwidth	$\pm 250\text{Hz}$ or less at 60dB
Ripple	2dB or less
Insertion loss	6dB or less
Guaranteed attenuation	80dB or more within 100Hz to 454.6kHz 80dB or more within 455.4kHz to 2MHz
Input and output impedance	2k $\Omega$ /15pF

**CW Crystal filter (L71-0239-25) : YG-455CN-1**

Item	Rating
Nominal center frequency	8830kHz
Center frequency deviation	Within $\pm 50\text{Hz}$ at 6dB
Passband width	$\pm 125\text{Hz}$ or more at 6dB
Attenuation bandwidth	$\pm 600\text{Hz}$ or less at 60dB
Ripple	2dB or less
Insertion loss	Within 8dB $\pm$ 2dB
Guaranteed attenuation	80dB or more in the range $\pm 2\text{kHz}$ to $\pm 1\text{MHz}$
Input and output impedance	600 $\Omega$ /15pF

**CW Crystal filter (L71-0407-05) : YK-88CN-1**

# TS-950SDX

## SPECIFICATIONS

Specifications		Model	TS-950SDX		
General	Mode	J3E (LSB, USB), A1A (CW), A3E (AM), F3E (FM), F1A (FSK)			
	Memory channels	100			
	Antenna impedance	50Ω (With antenna tuner 20 to 150Ω)			
	Power requirement	K and P type	120V AC ± 10%		
		M type	120/230V AC ± 10%		
		E type	230V AC ± 10%		
		X type	120/240V AC ± 10%		
		T type	220/240V AC ± 10%		
	Power dissipation	Receive mode with no input signal	110W		
		Transmit mode	700W (7.5A)		
	Operating temperature	-10 to +50°C (+14 to +122°F)			
	Frequency stability	Less than ±0.5 PPM			
	Frequency accuracy	Less than ±0.5 PPM			
	Dimensions (W x H x D) (Projection included)	409 x 154 x 446 mm (16-3/22" x 6-1/16" x 17-9/16")			
Weight	23kg (50.6 lbs)				
Transmitter	Frequency range	160m band	1.8 to 2.0MHz		
		80m band	3.5 to 4.0MHz		
		40m band	7.0 to 7.3MHz		
		30m band	10.1 to 10.15MHz		
		20m band	14.0 to 14.35MHz		
		17m band	18.068 to 18.168MHz		
		15m band	21.0 to 21.45MHz		
		12m band	24.89 to 24.99MHz		
		10m band	28.0 to 29.7MHz		
	Output power (With auto antenna tuner in "THRU")	1.9 to 28MHz	SSB, CW, FSK, FM	MAX	150W
				MIN	20W
			AM	MAX	40W
				MIN	10W
	Modulation	SSB	Balanced modulation		
		FM	Reactance modulation		
		AM	Low level modulation		
	Spurious radiation	Less than -40dB			
	Carrier suppression (With 1.5kHz reference)	More than 50dB			
	Unwanted sideband suppression (With 1.5kHz reference)	More than 60dB			
Maximum frequency deviation (FM)	Less than ±5kHz				
Frequency response (-6dB)	100 to 3100Hz				
XIT variable range	±9.99kHz				
Microphone impedance	250 to 600Ω				

## SPECIFICATIONS

Specifications		Model	TX-950SDX
Circuitry	Main	SSB, CW, FSK, AM	Quadruple conversion superheterodyne
	Sub	FM	Triple conversion superheterodyne
Frequency range			Double conversion superheterodyne
Intermediate frequency		Main	100kHz to 30MHz
		Sub	1st : 73.05MHz, 2nd : 8.83MHz, 3rd : 455kHz, 4th : 100kHz
Sensitivity	SSB, CW (at 10dB S+N/N)	100kHz to 150kHz	Less than 2.5 $\mu$ V
		150kHz to 490kHz	Less than 1 $\mu$ V
		490kHz to 1.705MHz	Less than 4 $\mu$ V
		1.62MHz to 30MHz	Less than 0.2 $\mu$ V
	AM (at 10dB S +N/N)	100kHz to 150kHz	Less than 25 $\mu$ V
		150kHz to 490kHz	Less than 10 $\mu$ V
		490kHz to 1.62MHz	Less than 32 $\mu$ V
	FM (at 12dB SINAD)	1.62MHz to 30MHz	Less than 2.0 $\mu$ V
		28MHz to 30MHz	Less than 0.5 $\mu$ V
Selectivity	SSB, AM (N), FSK		-6dB : 2.4kHz, -60dB : 3.4kHz
	AM (W)		-6dB : 6kHz, -50dB : 15kHz
	CW (W)		-6dB : 400Hz, -60dB : 900Hz
	FM		-6dB : 12kHz, -60dB : 24kHz
Image ratio			More than 80dB
1st IF rejection			More than 70dB
Notch filter attenuation			More than 45dB
RIT variable range			$\pm$ 9.99kHz
Squelch sensitivity	SSB, CW, FSK, AM	100kHz to 150kHz	Less than 6.3 $\mu$ V
		150kHz to 490kHz	Less than 2.5 $\mu$ V
		490kHz to 1.705MHz	Less than 10 $\mu$ V
		1.705MHz to 30MHz	Less than 0.5 $\mu$ V
	FM	28MHz to 30MHz	Less than 0.32 $\mu$ V
Output			1.5W across 8 $\Omega$ load (10% distortion)
Output load impedance			8 $\Omega$

Notes
